Table of Contents

1. Introduction 1

1.1 Downloading the Code Samples 1
1.2 Feedback 1
1.3 Errata 1

2. Setting up an Android Studio Development Environment 3

2.1 System Requirements 3
2.2 Installing the Java Development Kit (JDK) 3
2.2.1 Windows JDK Installation 3
2.2.2 Mac OS X JDK Installation 4
2.3 Linux JDK Installation 4
2.4 Downloading the Android Studio Package 5
2.5 Installing Android Studio 5
2.5.1 Installation on Windows 5
2.5.2 Installation on Mac OS X 6
2.5.3 Installation on Linux 7
2.6 The Android Studio Setup Wizard 7
2.7 Installing the Latest Android SDK Packages 8
2.8 Making the Android SDK Tools Command-line Accessible 10
2.8.1 Windows 7 10
2.8.2 Windows 8.1 11
2.8.3 Linux 11
2.8.4 Mac OS X 12
2.9 Updating the Android Studio and the SDK 12
2.10 Summary 12

3. Creating an Example Android App in Android Studio 13

3.1 Creating a New Android Project 13
3.2 Defining the Project and SDK Settings 14
3.3 Creating an Activity 15
3.4 Modifying the Example Application 16
3.5 Reviewing the Layout and Resource Files 20
3.6 Previewing the Layout 22
3.7 Summary 23

4. A Tour of the Android Studio User Interface 25

4.1 The Welcome Screen 25
4.2 The Main Window 26
4.3 The Tool Windows 27
4.4 Android Studio Keyboard Shortcuts 30
4.5 Switcher and Recent Files Navigation 30
4.6 Changing the Android Studio Theme 31
4.7 Summary 31

5. Creating an Android Virtual Device (AVD) in Android Studio 33

5.1 About Android Virtual Devices 33
5.2 Creating a New AVD 34

http://freepdf-books.com

5.3 Starting the Emulator 36
5.4 Running the Application in the AVD 36
5.5 Run/Debug Configurations 38
5.6 Stopping a Running Application 39
5.7 AVD Command-line Creation 41
5.8 Android Virtual Device Configuration Files 42
5.9 Moving and Renaming an Android Virtual Device 42
5.10 Summary 43

6. Testing Android Studio Apps on a Physical Android Device 45

6.1 An Overview of the Android Debug Bridge (ADB) 45
6.2 Enabling ADB on Android 5.0 based Devices 45
6.2.1 Mac OS X ADB Configuration 46
6.2.2 Windows ADB Configuration 47
6.2.3 Linux adb Configuration 49
6.3 Testing the adb Connection 50
6.4 Summary 51

7. The Basics of the Android Studio Code Editor 53

7.1 The Android Studio Editor 53
7.2 Splitting the Editor Window 55
7.3 Code Completion 56
7.4 Statement Completion 57
7.5 Parameter Information 57
7.6 Code Generation 57
7.7 Code Folding 59
7.8 Quick Documentation Lookup 60
7.9 Code Reformatting 60
7.10 Summary 61

8. An Overview of the Android Architecture 63

8.1 The Android Software Stack 63
8.2 The Linux Kernel 64
8.3 Android Runtime – ART 64
8.4 Android Libraries 65
8.4.1 C/C++ Libraries 65
8.5 Application Framework 66
8.6 Applications 66
8.7 Summary 66

9. The Anatomy of an Android Application 67

9.1 Android Activities 67
9.2 Android Intents 67
9.3 Broadcast Intents 68
9.4 Broadcast Receivers 68
9.5 Android Services 68
9.6 Content Providers 68
9.7 The Application Manifest 69
9.8 Application Resources 69
9.9 Application Context 69
9.10 Summary 69

http://freepdf-books.com

10. Understanding Android Application and Activity Lifecycles 71

10.1 Android Applications and Resource Management 71
10.2 Android Process States 71
10.2.1 Foreground Process 72
10.2.2 Visible Process 72
10.2.3 Service Process 72
10.2.4 Background Process 72
10.2.5 Empty Process 73
10.3 Inter-Process Dependencies 73
10.4 The Activity Lifecycle 73
10.5 The Activity Stack 73
10.6 Activity States 74
10.7 Configuration Changes 75
10.8 Handling State Change 75
10.9 Summary 75

11. Handling Android Activity State Changes 77

11.1 The Activity Class 77
11.2 Dynamic State vs. Persistent State 79
11.3 The Android Activity Lifecycle Methods 79
11.4 Activity Lifetimes 81
11.5 Summary 81

12. Android Activity State Changes by Example 83

12.1 Creating the State Change Example Project 83
12.2 Designing the User Interface 84
12.3 Overriding the Activity Lifecycle Methods 86
12.4 Filtering the LogCat Panel 88
12.5 Running the Application 89
12.6 Experimenting with the Activity 90
12.7 Summary 91

13. Saving and Restoring the State of an Android Activity 93

13.1 Saving Dynamic State 93
13.2 Default Saving of User Interface State 93
13.3 The Bundle Class 94
13.4 Saving the State 95
13.5 Restoring the State 96
13.6 Testing the Application 96
13.7 Summary 97

14. Understanding Android Views, View Groups and Layouts 99

14.1 Designing for Different Android Devices 99
14.2 Views and View Groups 99
14.3 Android Layout Managers 99
14.4 The View Hierarchy 100
14.5 Creating User Interfaces 102
14.6 Summary 102

15. A Guide to the Android Studio Designer Tool 103

http://freepdf-books.com

15.1 The Android Studio Designer 103
15.2 Design Mode 103
15.3 Text Mode 105
15.4 Setting Properties 105
15.5 Type Morphing 106
15.6 Creating a Custom Device Definition 107
15.7 Summary 107

16. Designing a User Interface using the Android Studio Designer Tool 109

16.1 An Android Studio Designer Tool Example 109
16.2 Creating a New Activity 109
16.3 Designing the User Interface 111
16.4 Editing View Properties 111
16.5 Running the Application 112
16.6 Manually Creating an XML Layout 112
16.7 Using the Hierarchy Viewer 114
16.8 Summary 117

17. Creating an Android User Interface in Java Code 119

17.1 Java Code vs. XML Layout Files 119
17.2 Creating Views 119
17.3 Properties and Layout Parameters 120
17.4 Creating the Example Project in Android Studio 120
17.5 Adding Views to an Activity 121
17.6 Setting View Properties 122
17.7 Adding Layout Parameters and Rules 123
17.8 Using View IDs 124
17.9 Converting Density Independent Pixels (dp) to Pixels (px) 126
17.10 Summary 128

18. Using the Android GridLayout Manager in Android Studio Designer 129

18.1 Introducing the Android GridLayout and Space Classes 129
18.2 The GridLayout Example 129
18.3 Creating the GridLayout Project 130
18.4 Creating the GridLayout Instance 130
18.5 Adding Views to GridLayout Cells 131
18.6 Moving and Deleting Rows and Columns 132
18.7 Implementing Cell Row and Column Spanning 132
18.8 Changing the Gravity of a GridLayout Child 133
18.9 Summary 136

19. Working with the Android GridLayout using XML Layout Resources 137

19.1 GridLayouts in XML Resource Files 137
19.2 Adding Child Views to the GridLayout 138
19.3 Declaring Cell Spanning, Gravity and Margins 139
19.4 Summary 141

20. An Overview and Example of Android Event Handling 143

20.1 Understanding Android Events 143
20.2 Using the android:onClick Resource 143
20.3 Event Listeners and Callback Methods 144

http://freepdf-books.com

20.4 An Event Handling Example 144
20.5 Designing the User Interface 145
20.6 The Event Listener and Callback Method 146
20.7 Consuming Events 147
20.8 Summary 148

21. Android Touch and Multi-touch Event Handling 151

21.1 Intercepting Touch Events 151
21.2 The MotionEvent Object 151
21.3 Understanding Touch Actions 151
21.4 Handling Multiple Touches 152
21.5 An Example Multi-Touch Application 152
21.6 Designing the Activity User Interface 153
21.7 Implementing the Touch Event Listener 154
21.8 Running the Example Application 157
21.9 Summary 157

22. Detecting Common Gestures using the Android Gesture Detector Class 159

22.1 Implementing Common Gesture Detection 159
22.2 Creating an Example Gesture Detection Project 160
22.3 Implementing the Listener Class 160
22.4 Creating the GestureDetectorCompat Instance 162
22.5 Implementing the onTouchEvent() Method 163
22.6 Testing the Application 164
22.7 Summary 164

23. Implementing Custom Gesture and Pinch Recognition on Android 165

23.1 The Android Gesture Builder Application 165
23.2 The GestureOverlayView Class 165
23.3 Detecting Gestures 165
23.4 Identifying Specific Gestures 165
23.5 Building and Running the Gesture Builder Application 166
23.6 Creating a Gestures File 166
23.7 Extracting the Gestures File from the SD Card 167
23.8 Creating the Example Project 168
23.9 Adding the Gestures File to the Project 168
23.10 Designing the User Interface 168
23.11 Loading the Gestures File 169
23.12 Registering the Event Listener 170
23.13 Implementing the onGesturePerformed Method 170
23.14 Testing the Application 172
23.15 Configuring the GestureOverlayView 172
23.16 Intercepting Gestures 172
23.17 Detecting Pinch Gestures 173
23.18 A Pinch Gesture Example Project 173
23.19 Summary 175

24. An Introduction to Android Fragments 177

24.1 What is a Fragment? 177
24.2 Creating a Fragment 177
24.3 Adding a Fragment to an Activity using the Layout XML File 178

http://freepdf-books.com

24.4 Adding and Managing Fragments in Code 180
24.5 Handling Fragment Events 181
24.6 Implementing Fragment Communication 182
24.7 Summary 183

25. Using Fragments in Android Studio - An Example 185

25.1 About the Example Fragment Application 185
25.2 Creating the Example Project 185
25.3 Creating the First Fragment Layout 185
25.4 Creating the First Fragment Class 187
25.5 Creating the Second Fragment Layout 188
25.6 Adding the Fragments to the Activity 190
25.7 Making the Toolbar Fragment Talk to the Activity 192
25.8 Making the Activity Talk to the Text Fragment 196
25.9 Testing the Application 197
25.10 Summary 197

26. An Android Studio Master/Detail Flow Tutorial 199

26.1 The Master/Detail Flow 199
26.2 Creating a Master/Detail Flow Activity 200
26.3 The Anatomy of the Master/Detail Flow Template 202
26.4 Modifying the Master/Detail Flow Template 203
26.5 Changing the Content Model 203
26.6 Changing the Detail Pane 204
26.7 Modifying the WebsiteDetailFragment Class 205
26.8 Adding Manifest Permissions 207
26.9 Running the Application 207
26.10 Summary 207

27. Creating and Managing Overflow Menus on Android 209

27.1 The Overflow Menu 209
27.2 Creating an Overflow Menu 209
27.3 Displaying an Overflow Menu 210
27.4 Responding to Menu Item Selections 211
27.5 Creating Checkable Item Groups 211
27.6 Creating the Example Project 212
27.7 Modifying the Menu Description 213
27.8 Modifying the onOptionsItemSelected() Method 214
27.9 Testing the Application 215
27.10 Summary 215

28. Animating User Interfaces with the Android Transitions Framework 217

28.1 Introducing Android Transitions and Scenes 217
28.2 Using Interpolators with Transitions 218
28.3 Working with Scene Transitions 218
28.4 Custom Transitions and TransitionSets in Code 219
28.5 Custom Transitions and TransitionSets in XML 220
28.6 Working with Interpolators 221
28.7 Creating a Custom Interpolator 223
28.8 Using the beginDelayedTransition Method 224
28.9 Summary 224

http://freepdf-books.com

29. An Android Transition Tutorial using beginDelayedTransition 225

29.1 Creating the Android Studio TransitionDemo Project 225
29.2 Preparing the Project Files 225
29.3 Implementing beginDelayedTransition Animation 225
29.4 Customizing the Transition 228
29.5 Summary 229

30. Implementing Android Scene Transitions – A Tutorial 231

30.1 An Overview of the Scene Transition Project 231
30.2 Creating the Android Studio SceneTransitions Project 231
30.3 Identifying and Preparing the Root Container 231
30.4 Designing the First Scene 231
30.5 Designing the Second Scene 234
30.6 Entering the First Scene 235
30.7 Loading Scene 2 236
30.8 Implementing the Transitions 236
30.9 Adding the Transition File 237
30.10 Loading and Using the Transition Set 237
30.11 Configuring Additional Transitions 238
30.12 Summary 239

31. An Overview of Android Intents 241

31.1 An Overview of Intents 241
31.2 Explicit Intents 241
31.3 Returning Data from an Activity 242
31.4 Implicit Intents 243
31.5 Using Intent Filters 244
31.6 Checking Intent Availability 244
31.7 Summary 245

32. Android Explicit Intents – A Worked Example 247

32.1 Creating the Explicit Intent Example Application 247
32.2 Designing the User Interface Layout for ActivityA 247
32.3 Creating the Second Activity Class 249
32.4 Designing the User Interface Layout for ActivityB 250
32.5 Reviewing the Application Manifest File 251
32.6 Creating the Intent 252
32.7 Extracting Intent Data 253
32.8 Launching ActivityB as a Sub-Activity 253
32.9 Returning Data from a Sub-Activity 254
32.10 Testing the Application 255
32.11 Summary 255

33. Android Implicit Intents – A Worked Example 257

33.1 Creating the Android Studio Implicit Intent Example Project 257
33.2 Designing the User Interface 257
33.3 Creating the Implicit Intent 258
33.4 Adding a Second Matching Activity 259
33.5 Adding the Web View to the UI 259
33.6 Obtaining the Intent URL 260

http://freepdf-books.com

33.7 Modifying the MyWebView Project Manifest File 261
33.8 Installing the MyWebView Package on a Device 263
33.9 Testing the Application 264
33.10 Summary 264

34. Android Broadcast Intents and Broadcast Receivers 265

34.1 An Overview of Broadcast Intents 265
34.2 An Overview of Broadcast Receivers 266
34.3 Obtaining Results from a Broadcast 267
34.4 Sticky Broadcast Intents 267
34.5 The Broadcast Intent Example 267
34.6 Creating the Example Application 268
34.7 Creating and Sending the Broadcast Intent 268
34.8 Creating the Broadcast Receiver 269
34.9 Configuring a Broadcast Receiver in the Manifest File 270
34.10 Testing the Broadcast Example 271
34.11 Listening for System Broadcasts 271
34.12 Summary 272

35. A Basic Overview of Android Threads and Thread Handlers 273

35.1 An Overview of Threads 273
35.2 The Application Main Thread 273
35.3 Thread Handlers 273
35.4 A Basic Threading Example 273
35.5 Creating a New Thread 276
35.6 Implementing a Thread Handler 277
35.7 Passing a Message to the Handler 278
35.8 Summary 280

36. An Overview of Android Started and Bound Services 281

36.1 Started Services 281
36.2 Intent Service 281
36.3 Bound Service 282
36.4 The Anatomy of a Service 282
36.5 Controlling Destroyed Service Restart Options 283
36.6 Declaring a Service in the Manifest File 283
36.7 Starting a Service Running on System Startup 284
36.8 Summary 284

37. Implementing an Android Started Service – A Worked Example 285

37.1 Creating the Example Project 285
37.2 Creating the Service Class 285
37.3 Adding the Service to the Manifest File 286
37.4 Starting the Service 287
37.5 Testing the IntentService Example 288
37.6 Using the Service Class 288
37.7 Creating the New Service 288
37.8 Modifying the User Interface 290
37.9 Running the Application 291
37.10 Creating a New Thread for Service Tasks 291
37.11 Summary 293

http://freepdf-books.com

38. Android Local Bound Services – A Worked Example 295

38.1 Understanding Bound Services 295
38.2 Bound Service Interaction Options 295
38.3 An Android Studio Local Bound Service Example 295
38.4 Adding a Bound Service to the Project 296
38.5 Implementing the Binder 296
38.6 Binding the Client to the Service 298
38.7 Completing the Example 300
38.8 Testing the Application 302
38.9 Summary 302

39. Android Remote Bound Services – A Worked Example 303

39.1 Client to Remote Service Communication 303
39.2 Creating the Example Application 303
39.3 Designing the User Interface 303
39.4 Implementing the Remote Bound Service 304
39.5 Configuring a Remote Service in the Manifest File 305
39.6 Launching and Binding to the Remote Service 306
39.7 Sending a Message to the Remote Service 307
39.8 Summary 308

40. An Overview of Android SQLite Databases 309

40.1 Understanding Database Tables 309
40.2 Introducing Database Schema 309
40.3 Columns and Data Types 309
40.4 Database Rows 310
40.5 Introducing Primary Keys 310
40.6 What is SQLite? 310
40.7 Structured Query Language (SQL) 310
40.8 Trying SQLite on an Android Virtual Device (AVD) 311
40.9 Android SQLite Java Classes 313
40.9.1 Cursor 313
40.9.2 SQLiteDatabase 313
40.9.3 SQLiteOpenHelper 313
40.9.4 ContentValues 314
40.10 Summary 314

41. An Android TableLayout and TableRow Tutorial 315

41.1 The TableLayout and TableRow Layout Views 315
41.2 Creating the Database Project 317
41.3 Adding the TableLayout to the User Interface 317
41.4 Adding and Configuring the TableRows 317
41.5 Adding the Button Bar to the Layout 318
41.6 Adjusting the Layout Margins 319
41.7 Summary 322

42. An Android SQLite Database Tutorial 323

42.1 About the Database Example 323
42.2 Creating the Data Model 323
42.3 Implementing the Data Handler 325

http://freepdf-books.com

42.3.1 The Add Handler Method *326*
42.3.2 The Query Handler Method *327*
42.3.3 The Delete Handler Method *327*
42.4 Implementing the Activity Event Methods 328
42.5 Testing the Application 330
42.6 Summary 330

43. Understanding Android Content Providers 331

43.1 What is a Content Provider? 331
43.2 The Content Provider 331
43.2.1 onCreate() *331*
43.2.2 query() *331*
43.2.3 insert() *331*
43.2.4 update() *332*
43.2.5 delete() *332*
43.2.6 getType() *332*
43.3 The Content URI 332
43.4 The Content Resolver 332
43.5 The <provider> Manifest Element 333
43.6 Summary 333

44. Implementing an Android Content Provider in Android Studio 335

44.1 Copying the Database Project 335
44.2 Adding the Content Provider Package 335
44.3 Creating the Content Provider Class 336
44.4 Constructing the Authority and Content URI 337
44.5 Implementing URI Matching in the Content Provider 338
44.6 Implementing the Content Provider onCreate() Method 339
44.7 Implementing the Content Provider insert() Method 340
44.8 Implementing the Content Provider query() Method 341
44.9 Implementing the Content Provider update() Method 342
44.10 Implementing the Content Provider delete() Method 343
44.11 Declaring the Content Provider in the Manifest File 344
44.12 Modifying the Database Handler 345
44.13 Summary 346

45. Accessing Cloud Storage using the Android Storage Access Framework 349

45.1 The Storage Access Framework 349
45.2 Working with the Storage Access Framework 350
45.3 Filtering Picker File Listings 350
45.4 Handling Intent Results 351
45.5 Reading the Content of a File 352
45.6 Writing Content to a File 353
45.7 Deleting a File 353
45.8 Gaining Persistent Access to a File 353
45.9 Summary 354

46. An Android Storage Access Framework Example 355

46.1 About the Storage Access Framework Example 355
46.2 Creating the Storage Access Framework Example 355
46.3 Designing the User Interface 355

http://freepdf-books.com

46.4 Declaring Request Codes 357
46.5 Creating a New Storage File 358
46.6 The onActivityResult() Method 359
46.7 Saving to a Storage File 360
46.8 Opening and Reading a Storage File 363
46.9 Testing the Storage Access Application 365
46.10 Summary 365

47. Implementing Video Playback on Android using the VideoView and MediaController Classes 367

47.1 Introducing the Android VideoView Class 367
47.2 Introducing the Android MediaController Class 368
47.3 Testing Video Playback 368
47.4 Creating the Video Playback Example 368
47.5 Designing the VideoPlayer Layout 368
47.6 Configuring the VideoView 369
47.7 Adding Internet Permission 370
47.8 Adding the MediaController to the Video View 371
47.9 Setting up the onPreparedListener 372
47.10 Summary 373

48. Video Recording and Image Capture on Android using Camera Intents 375

48.1 Checking for Camera Support 375
48.2 Calling the Video Capture Intent 375
48.3 Calling the Image Capture Intent 377
48.4 Creating an Android Studio Video Recording Project 377
48.5 Designing the User Interface Layout 377
48.6 Checking for the Camera 378
48.7 Launching the Video Capture Intent 379
48.8 Handling the Intent Return 380
48.9 Testing the Application 381
48.10 Summary 381

49. Android Audio Recording and Playback using MediaPlayer and MediaRecorder 383

49.1 Playing Audio 383
49.2 Recording Audio and Video using the MediaRecorder Class 384
49.3 About the Example Project 384
49.4 Creating the AudioApp Project 385
49.5 Designing the User Interface 385
49.6 Checking for Microphone Availability 386
49.7 Performing the Activity Initialization 386
49.8 Implementing the recordAudio() Method 388
49.9 Implementing the stopAudio() Method 388
49.10 Implementing the playAudio() method 389
49.11 Configuring Permissions in the Manifest File 389
49.12 Testing the Application 390
49.13 Summary 390

50. Working with the Google Maps Android API in Android Studio 391

50.1 The Elements of the Google Maps Android API 391
50.2 Creating the Google Maps Project 392
50.3 Obtaining Your Developer Signature 392

http://freepdf-books.com

50.4 Testing the Application 393
50.5 Understanding Geocoding and Reverse Geocoding 394
50.6 Adding a Map to an Application 396
50.7 Displaying the User's Current Location 396
50.8 Changing the Map Type 396
50.9 Displaying Map Controls to the User 397

Chapter 1

1. Introduction

The goal of this book is to teach the skills necessary to develop Android based applications using the Android Studio Integrated Development Environment (IDE) and the Android 5 Software Development Kit (SDK).

Beginning with the basics, this book provides an outline of the steps necessary to set up an Android development and testing environment. An overview of Android Studio is included covering areas such as tool windows, the code editor and the Designer tool. An introduction to the architecture of Android is followed by an in-depth look at the design of Android applications and user interfaces using the Android Studio environment. More advanced topics such as database management, content providers and intents are also covered, as are touch screen handling, gesture recognition, camera access and the playback and recording of both video and audio. This edition of the book also covers printing, transitions and cloud-based file storage.

In addition to covering general Android development techniques, the book also includes Google Play specific topics such as implementing maps using the Google Maps Android API, in-app billing and submitting apps to the Google Play Developer Console.

Chapters also cover advanced features of Android Studio such as Gradle build configuration and the implementation of build variants to target multiple Android device types from a single project code base.

Assuming you already have some Java programming experience, are ready to download Android Studio and the Android SDK, have access to a Windows, Mac or Linux system and ideas for some apps to develop, you are ready to get started.

1.1 Downloading the Code Samples

The source code and Android Studio project files for the examples contained in this book are available for download at:

http://www.ebookfrenzy.com/direct/androidstudio/index.php

The steps to load a project from the code samples into Android Studio are as follows:

1. From the *Welcome to Android Studio* dialog, select the *Import Non-Android Studio project* option.
2. In the project selection dialog, navigate to and select the folder containing the project to be imported and click on OK.
3. Click on OK in the *Sync Android SDKs* dialog.
4. Click Yes in the *Language Level Changed* dialog if it appears.

1.2 Feedback

We want you to be satisfied with your purchase of this book. If you find any errors in the book, or have any comments, questions or concerns please contact us at *feedback@ebookfrenzy.com*.

1.3 Errata

Whilst we make every effort to ensure the accuracy of the content of this book, it is inevitable that a book covering a subject area of this size and complexity may include some errors and oversights. Any known issues with the book will be outlined, together with solutions, at the following URL:

http://www.ebookfrenzy.com/errata/androidstudio.html

http://freepdf-books.com

In the event that you find an error not listed in the errata, please let us know by emailing our technical support team at *feedback@ebookfrenzy.com*. They are there to help you and will work to resolve any problems you may encounter.

http://freepdf-books.com

Chapter 2

2. Setting up an Android Studio Development Environment

Before any work can begin on the development of an Android application, the first step is to configure a computer system to act as the development platform. This involves a number of steps consisting of installing the Java Development Kit (JDK) and the Android Studio Integrated Development Environment (IDE) which also includes the Android Software Development Kit (SDK).

This chapter will cover the steps necessary to install the requisite components for Android application development on Windows, Mac OS X and Linux based systems.

2.1 System Requirements

Android application development may be performed on any of the following system types:

- Windows 2003 (32-bit or 64-bit)
- Windows Vista (32-bit or 64-bit)
- Windows 7 (32-bit or 64-bit)
- Windows 8 / Windows 8.1
- Mac OS X 10.8.5 or later (Intel based systems only)
- Linux systems with version 2.11 or later of GNU C Library (glibc)
- Minimum of 2GB of RAM (4GB is preferred)
- 1.5GB of available disk space

2.2 Installing the Java Development Kit (JDK)

The Android SDK was developed using the Java programming language. Similarly, Android applications are also developed using Java. As a result, the Java Development Kit (JDK) is the first component that must be installed.

Android development requires the installation of either version 6 or 7 of the Standard Edition of the Java Platform Development Kit. Java is provided in both development (JDK) and runtime (JRE) packages. For the purposes of Android development, the JDK must be installed.

2.2.1 Windows JDK Installation

For Windows systems, the JDK may be obtained from Oracle Corporation's website using the following URL:

http://www.oracle.com/technetwork/java/javase/downloads/index.html

Assuming that a suitable JDK is not already installed on your system, download the latest JDK package that matches the destination computer system. Once downloaded, launch the installation executable and follow the on screen instructions to complete the installation process.

http://freepdf-books.com

2.2.2 Mac OS X JDK Installation

Java is not installed by default on recent versions of Mac OS X. To confirm the presence or otherwise of Java, open a Terminal window and enter the following command:

```
java -version
```

Assuming that Java is currently installed, output similar to the following will appear in the terminal window:

```
java version "1.7.0_71"
Java(TM) SE Runtime Environment (build 1.7.0_71-b14)
Java HotSpot(TM) 64-Bit Server VM (build 24.71-b01, mixed mode)
```

In the event that Java is not installed, issuing the "java" command in the terminal window will result in the appearance of a message which reads as follows together with a dialog on the desktop providing a More Info button which, when clicked will display the Oracle Java web page:

```
No Java runtime present, requesting install
```

On the Oracle Java web page, locate and download the Java SE 7 JDK installation package for Mac OS X.

Open the downloaded disk image (.dmg file) and double-click on the icon to install the Java package (Figure 2-1):

Figure 2-1

The Java for OS X installer window will appear and take you through the steps involved in installing the JDK. Once the installation is complete, return to the Terminal window and run the following command, at which point the previously outlined Java version information should appear:

```
java -version
```

2.3 Linux JDK Installation

Firstly, if the chosen development system is running the 64-bit version of Ubuntu then it is essential that the 32-bit library support package be installed:

```
sudo apt-get install ia32-libs
```

As with Windows based JDK installation, it is possible to install the JDK on Linux by downloading the appropriate package from the Oracle web site, the URL for which is as follows:

http://www.oracle.com/technetwork/java/javase/downloads/index.html

Packages are provided by Oracle in RPM format (for installation on Red Hat Linux based systems such as Red Hat Enterprise Linux, Fedora and CentOS) and as a tar archive for other Linux distributions such as Ubuntu.

http://freepdf-books.com

On Red Hat based Linux systems, download the .rpm JDK file from the Oracle web site and perform the installation using the *rpm* command in a terminal window. Assuming, for example, that the downloaded JDK file was named *jdk-7u71-linux-x64.rpm*, the commands to perform the installation would read as follows:

```
su
rpm –ihv jdk-7u71-linux-x64.rpm
```

To install using the compressed tar package (tar.gz) perform the following steps:

1. Create the directory into which the JDK is to be installed (for the purposes of this example we will assume */home/demo/java*).

2. Download the appropriate tar.gz package from the Oracle web site into the directory.

3. Execute the following command (where *<jdk-file>* is replaced by the name of the downloaded JDK file):

```
tar xvfz  <jdk-file>.tar.gz
```

4. Remove the downloaded tar.gz file.

5. Add the path to the *bin* directory of the JDK installation to your $PATH variable. For example, assuming that the JDK ultimately installed into */home/demo/java/jdk1.7.0_71* the following would need to be added to your $PATH environment variable:

```
/home/demo/java/jdk1.7.0_71/bin
```

This can typically be achieved by adding a command to the *.bashrc* file in your home directory (specifics may differ depending on the particular Linux distribution in use). For example, change directory to your home directory, edit the *.bashrc* file contained therein and add the following line at the end of the file (modifying the path to match the location of the JDK on your system):

```
export PATH=/home/demo/java/jdk1.7.0_71/bin:$PATH
```

Having saved the change, future terminal sessions will include the JDK in the $PATH environment variable.

2.4 Downloading the Android Studio Package

Most of the work involved in developing applications for Android will be performed using the Android Studio environment. Android Studio may be downloaded from the following web page:

http://developer.android.com/sdk/index.html

From this page, either click on the download button if it lists the correct platform (for example on a Windows based web browser the button will read “Download Android Studio for Windows”), or select the “Other Download Options” link to manually select the appropriate package for your platform and operating system. On the subsequent screen, accept the terms and conditions to initiate the download.

2.5 Installing Android Studio

Once downloaded, the exact steps to install Android Studio differ depending on the operating system on which the installation is being performed.

2.5.1 Installation on Windows

Locate the downloaded Android Studio installation executable file (named *android-studio-bundle-<version>*.exe) in a Windows Explorer window and double click on it to start the installation process, clicking the *Yes* button in the User Account Control dialog if it appears.

http://freepdf-books.com

Once the Android Studio setup wizard appears, work through the various screens to configure the installation to meet your requirements in terms of the file system location into which Android Studio should be installed and whether or not it should be made available to other users of the system. Although there are no strict rules on where Android Studio should be installed on the system, the remainder of this book will assume that the installation was performed into a sub-folder of the user's home directory named *android-studio*. Once the options have been configured, click on the *Install* button to begin the installation process.

On versions of Windows with a Start menu, the newly installed Android Studio can be launched from the entry added to that menu during the installation. On Windows 8, the executable can be pinned to the task bar for easy access by navigating to the *android-studio\bin* directory, right-clicking on the executable and selecting the *Pin to Taskbar* menu option. Note that the executable is provided in 32-bit (*studio*) and 64-bit (*studio64*) executable versions. If you are running a 32-bit system be sure to use the *studio* executable.

2.5.2 Installation on Mac OS X

Android Studio for Mac OS X is downloaded in the form of a disk image (.dmg) file. Once the *android-studio-ide-<version>.dmg* file has been downloaded, locate it in a Finder window and double click on it to open it as shown in Figure 2-2:

Figure 2-2

To install the package, simply drag the Android Studio icon and drop it onto the Applications folder. The Android Studio package will then be installed into the Applications folder of the system, a process which will typically take a few minutes to complete.

To launch Android Studio, locate the executable in the Applications folder using a Finder window and double click on it. When attempting to launch Android Studio, an error dialog may appear indicating that the JVM cannot be found. If this error occurs, it will be necessary to download and install the Mac OS X Java 6 JRE package on the system. This can be downloaded from Apple using the following link:

http://support.apple.com/kb/DL1572

Once the Java for OS X package has been installed, Android Studio should launch without any problems.

For future easier access to the tool, drag the Android Studio icon from the Finder window and drop it onto the dock.

http://freepdf-books.com

2.5.3 Installation on Linux

Having downloaded the Linux Android Studio package, open a terminal window, change directory to the location where Android Studio is to be installed and execute the following command:

```
unzip /<path to package>/android-studio-ide-<version>-linux.zip
```

Note that the Android Studio bundle will be installed into a sub-directory named *android-studio.* Assuming, therefore, that the above command was executed in */home/demo*, the software packages will be unpacked into */home/demo/android-studio.*

To launch Android Studio, open a terminal window, change directory to the *android-studio/bin* sub-directory and execute the following command:

```
./studio.sh
```

2.6 The Android Studio Setup Wizard

The first time that Android Studio is launched after being installed, a dialog will appear providing the option to import settings from a previous Android Studio version. If you have settings from a previous version and would like to import them into the latest installation, select the appropriate option and location. Alternatively, indicate that you do not need to import any previous settings and click on the OK button to proceed.

After Android Studio has finished loading, the setup wizard will appear as shown in Figure 2-3.

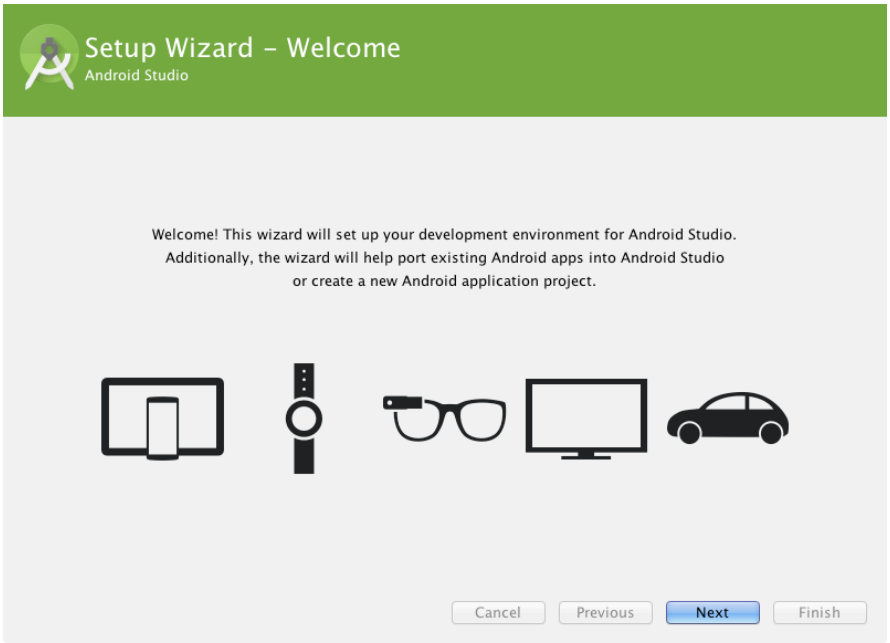

Figure 2-3

Click on the Next button, choose the Standard installation option and click on Next once again. On the license agreement screen, select and accept each of the licenses listed before clicking on Finish to complete the setup process. The Welcome to Android Studio screen should then appear:

http://freepdf-books.com

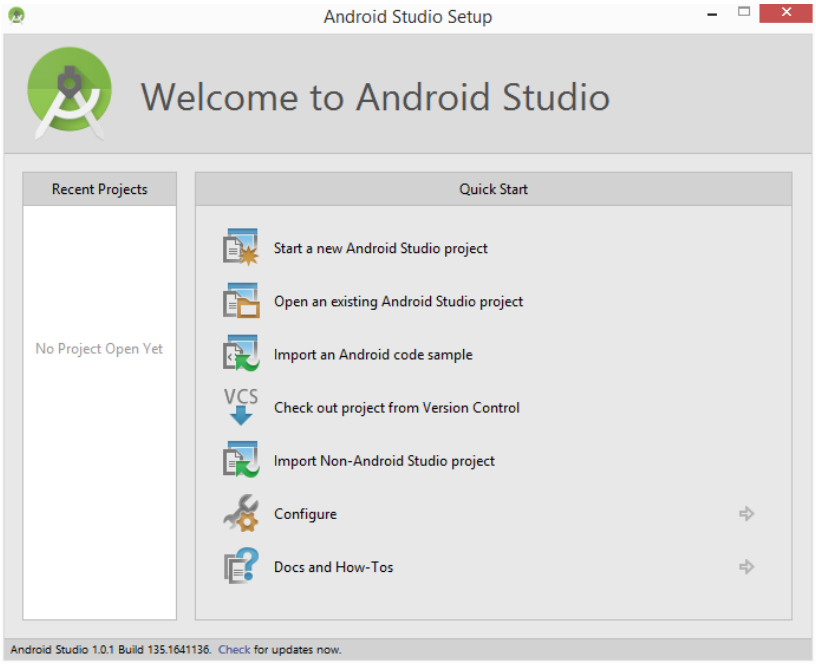

Figure 2-4

2.7 Installing the Latest Android SDK Packages

The steps performed so far have installed Java, the Android Studio IDE and the current set of default Android SDK packages. Before proceeding, it is worth taking some time to verify which packages are installed and to install any missing packages.

This task can be performed using the *Android SDK Manager*, which may be launched from within the Android Studio tool by selecting the *Configure -> SDK Manager* option from within the Android Studio welcome dialog. Once invoked, the SDK Manager tool will appear as illustrated in Figure 2-5:

http://freepdf-books.com

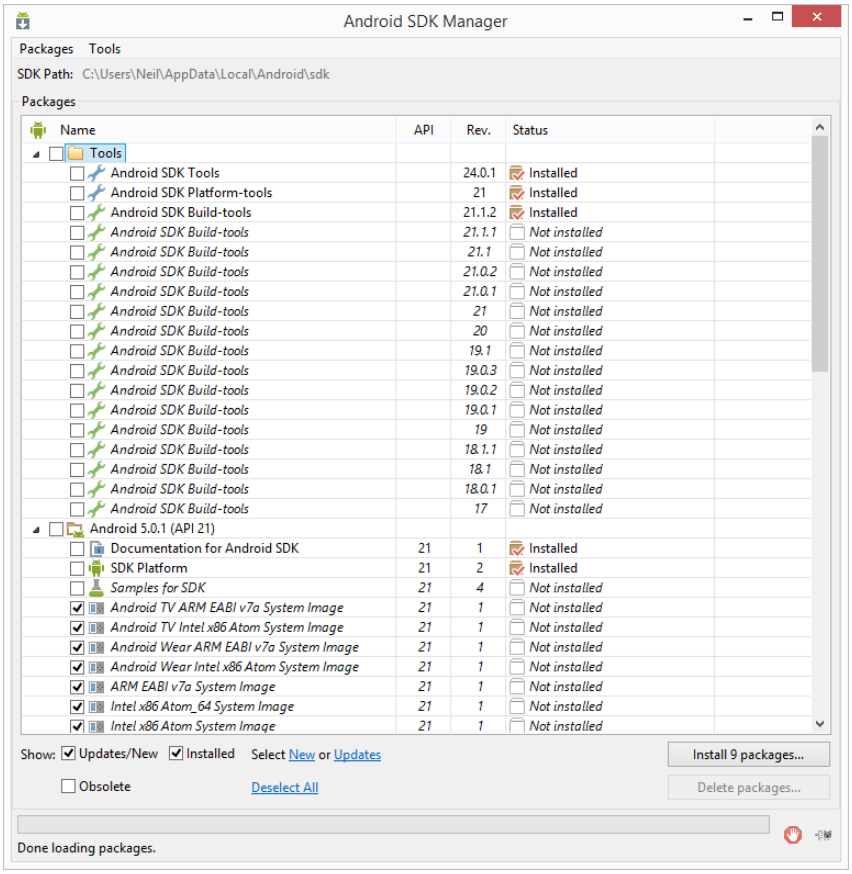

Figure 2-5

Within the Android SDK Manager, make sure that the following packages are listed as *Installed* in the Status column:

- Tools > Android SDK Tools
- Tools > Android SDK Platform-tools
- Tools > Android SDK Build-tools
- SDK Platform (most recent version) > SDK Platform
- SDK Platform (most recent version) > ARM EABI v7a System Image
- Extras > Android Support Repository
- Extras > Android Support Library
- Extras > Google Repository
- Extras > Google USB Driver (Required on Windows systems only)
- Extras > Intel x86 Emulator Accelerator (HAXM installer)

In the event that any of the above packages are listed as *Not Installed*, simply select the checkboxes next to those packages and click on the *Install packages* button to initiate the installation process. In the resulting dialog, accept the license agreements before clicking on the *Install* button. The SDK Manager will then begin to download and install the designated packages. As the installation proceeds, a progress bar will appear at the bottom of the manager window indicating the status of the installation.

Once the installation is complete, review the package list and make sure that the selected packages are now listed as *Installed* in the *Status* column. If any are listed as *Not installed,* make sure they are selected and click on the *Install packages…* button again.

http://freepdf-books.com

2.8 Making the Android SDK Tools Command-line Accessible

Most of the time, the underlying tools of the Android SDK will be accessed from within the Android Studio environment. That being said, however, there will also be instances where it will be useful to be able to invoke those tools from a command prompt or terminal window. In order for the operating system on which you are developing to be able to find these tools, it will be necessary to add them to the system's *PATH* environment variable.

Regardless of operating system, the PATH variable needs to be configured to include the following paths (where *<path_to_android_sdk_installation>* represents the file system location into which the Android SDK was installed):

```
<path_to_android_sdk_installation>/sdk/tools
<path_to_android_sdk_installation>/sdk/platform-tools
```

The location of the SDK on your system can be identified by launching the SDK Manager and referring to the *SDK Path:* field located at the top of the manager window as highlighted in Figure 2-6:

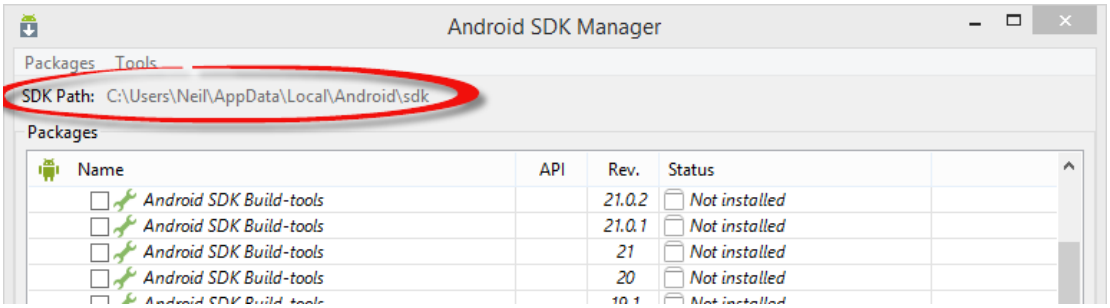

Figure 2-6

Once the location of the SDK has been identified, the steps to add this to the PATH variable are operating system dependent:

2.8.1 Windows 7

1. Right-click on *Computer* in the desktop start menu and select *Properties* from the resulting menu.
2. In the properties panel, select the *Advanced System Settings* link and, in the resulting dialog, click on the *Environment Variables…* button.
3. In the Environment Variables dialog, locate the *Path* variable in the *System variables* list, select it and click on *Edit…*. Locate the end of the current variable value string and append the path to the android platform tools to the end, using a semicolon to separate the path from the preceding values. For example, assuming Android Studio was installed into *C:\Users\demo\AppData\Local\Android\sdk*, the following would be appended to the end of the current Path value:

```
;C\Users\demo\AppData\Local\Android/sdk\platform-tools;C:\
\Users\demo\AppData\Local\Android\sdk\tools
```

4. Click on OK in each dialog box and close the system properties control panel.

Once the above steps are complete, verify that the path is correctly set by opening a *Command Prompt* window (*Start -> All Programs -> Accessories -> Command Prompt*) and at the prompt enter:

```
echo %Path%
```

The returned path variable value should include the paths to the Android SDK platform tools folders. Verify that the *platform-tools* value is correct by attempting to run the *adb* tool as follows:

```
adb
```

The tool should output a list of command line options when executed.

http://freepdf-books.com

Similarly, check the *tools* path setting by attempting to launch the Android SDK Manager:

```
android
```

In the event that a message similar to the following message appears for one or both of the commands, it is most likely that an incorrect path was appended to the Path environment variable:

```
'adb' is not recognized as an internal or external command,
operable program or batch file.
```

2.8.2 Windows 8.1

1. On the start screen, move the mouse to the bottom right hand corner of the screen and select *Search* from the resulting menu. In the search box, enter *Control Panel*. When the Control Panel icon appears in the results area, click on it to launch the tool on the desktop.
2. Within the Control Panel, use the *Category* menu to change the display to *Large Icons.* From the list of icons select the one labeled *System*.
3. Follow the steps outlined for Windows 7 starting from step 2 through to step 4.

Open the command prompt window (move the mouse to the bottom right hand corner of the screen, select the Search option and enter *cmd* into the search box). Select *Command Prompt* from the search results.

Within the Command Prompt window, enter:

```
echo %Path%
```

The returned path variable value should include the paths to the Android SDK platform tools folders. Verify that the *platform-tools* value is correct by attempting to run the *adb* tool as follows:

```
adb
```

The tool should output a list of command line options when executed.

Similarly, check the *tools* path setting by attempting to launch the Android SDK Manager:

```
android
```

In the event that a message similar to the following message appears for one or both of the commands, it is most likely that an incorrect path was appended to the Path environment variable:

```
'adb' is not recognized as an internal or external command,
operable program or batch file.
```

2.8.3 Linux

On Linux this will involve once again editing the *.bashrc* file. Assuming that the Android SDK bundle package was installed into */home/demo/Android/sdk*, the export line in the *.bashrc* file would now read as follows:

```
export PATH=/home/demo/java/jdk1.7.0_10/bin:/home/demo/Android/sdk/platform-
tools:/home/demo/Android/sdk/tools:/home/demo/android-studio/bin:$PATH
```

Note also that the above command adds the *android-studio/bin* directory to the PATH variable. This will enable the *studio.sh* script to be executed regardless of the current directory within a terminal window.

http://freepdf-books.com

2.8.4 Mac OS X

A number of techniques may be employed to modify the $PATH environment variable on Mac OS X. Arguably the cleanest method is to add a new file in the */etc/paths.d* directory containing the paths to be added to $PATH. Assuming an Android SDK installation location of */Users/demo/Library/Android/sdk*, the path may be configured by creating a new file named *android-sdk* in the */etc/paths.d* directory containing the following lines:

```
/Users/demo/Library/Android/sdk/tools
/Users/demo/Library/Android/sdk/platform-tools
```

Note that since this is a system directory it will be necessary to use the *sudo* command when creating the file. For example:

```
sudo vi /etc/paths.d/android-sdk
```

2.9 Updating the Android Studio and the SDK

From time to time new versions of Android Studio and the Android SDK are released. New versions of the SDK are installed using the Android SDK Manager. Android Studio will typically notify you when an update is ready to be installed.

To manually check for Android Studio updates, click on the *Check for updates now* link located at the bottom of the Android Studio welcome screen, or use the *Help -> Check for Update…* menu option accessible from within the Android Studio main window.

2.10 Summary

Prior to beginning the development of Android based applications, the first step is to set up a suitable development environment. This consists of the Java Development Kit (JDK), Android SDKs, and Android Studio IDE. In this chapter, we have covered the steps necessary to install these packages on Windows, Mac OS X and Linux.

http://freepdf-books.com

Chapter 3

3. Creating an Example Android App in Android Studio

The preceding chapters of this book have covered the steps necessary to configure an environment suitable for the development of Android applications using the Android Studio IDE. Before moving on to slightly more advanced topics, now is a good time to validate that all of the required development packages are installed and functioning correctly. The best way to achieve this goal is to create an Android application and compile and run it. This chapter will cover the creation of a simple Android application project using Android Studio. Once the project has been created, a later chapter will explore the use of the Android emulator environment to perform a test run of the application.

3.1 Creating a New Android Project

The first step in the application development process is to create a new project within the Android Studio environment. Begin, therefore, by launching Android Studio so that the "Welcome to Android Studio" screen appears as illustrated in Figure 3-1:

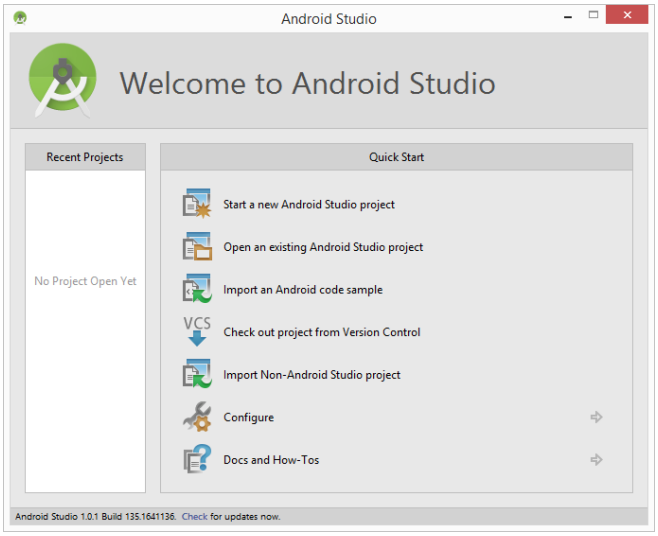

Figure 3-1

Once this window appears, Android Studio is ready for a new project to be created. To create the new project, simply click on the *Start a new Android Studio project* option to display the first screen of the *New Project* wizard as shown in Figure 3-2:

http://freepdf-books.com

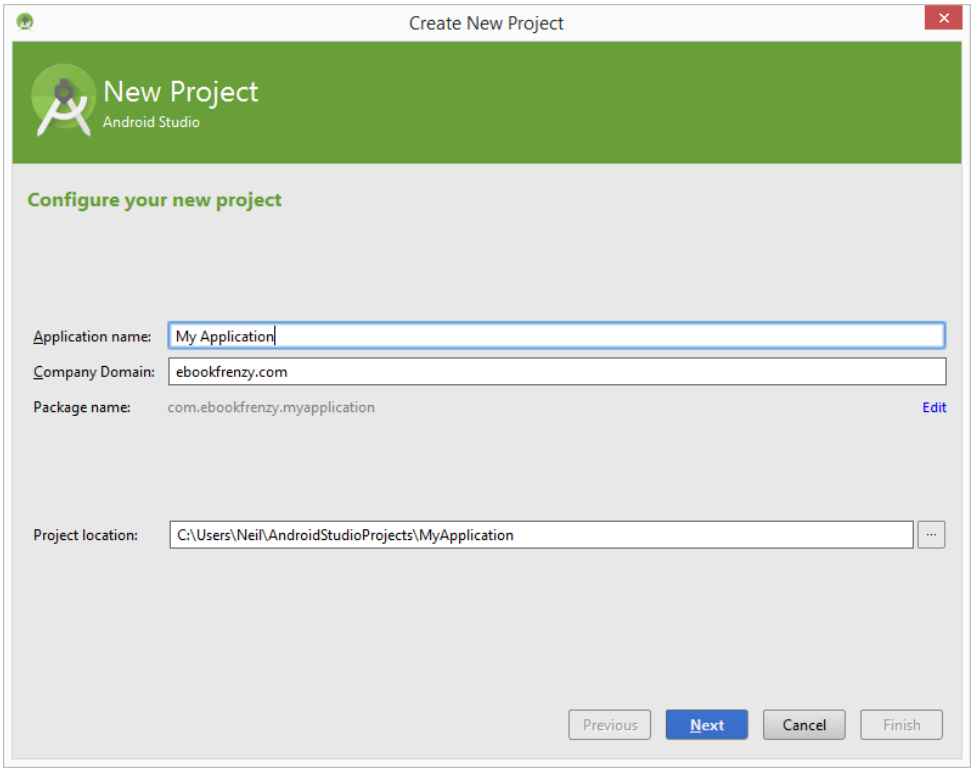

Figure 3-2

3.2 Defining the Project and SDK Settings

In the *New Project* window, set the *Application name* field to *AndroidSample*. The application name is the name by which the application will be referenced and identified within Android Studio and is also the name that will be used when the completed application goes on sale in the Google Play store.

The *Package Name* is used to uniquely identify the application within the Android application ecosystem. It should be based on the reversed URL of your domain name followed by the name of the application. For example, if your domain is *www.mycompany.com*, and the application has been named *AndroidSample*, then the package name might be specified as follows:

```
com.mycompany.androidsample
```

If you do not have a domain name, you may also use *ebookfrenzy.com* for the purposes of testing, though this will need to be changed before an application can be published:

```
com.ebookfrenzy.androidsample
```

The *Project location* setting will default to a location in the folder named *AndroidStudioProjects* located in your home directory and may be changed by clicking on the button to the right of the text field containing the current path setting.

Click Next to proceed. On the form factors screen, enable the *Phone and Tablet* option and set the minimum SDK setting to API 8: Android 2.2 (Froyo). The reason for selecting an older SDK release is that this ensures that the finished application will be able to run on the widest possible range of Android devices. The higher the minimum SDK selection, the more the application will be restricted to newer Android devices. A useful chart (Figure 3-3) can be viewed by clicking on the *Help me choose* link. This outlines the various SDK versions and API levels available for use and the percentage of Android devices in the marketplace on which the application will run if that SDK is used as the minimum level. In general it should only be necessary to select a more

http://freepdf-books.com

recent SDK when that release contains a specific feature that is required for your application. To help in the decision process, selecting an API level from the chart will display the features that are supported at that level.

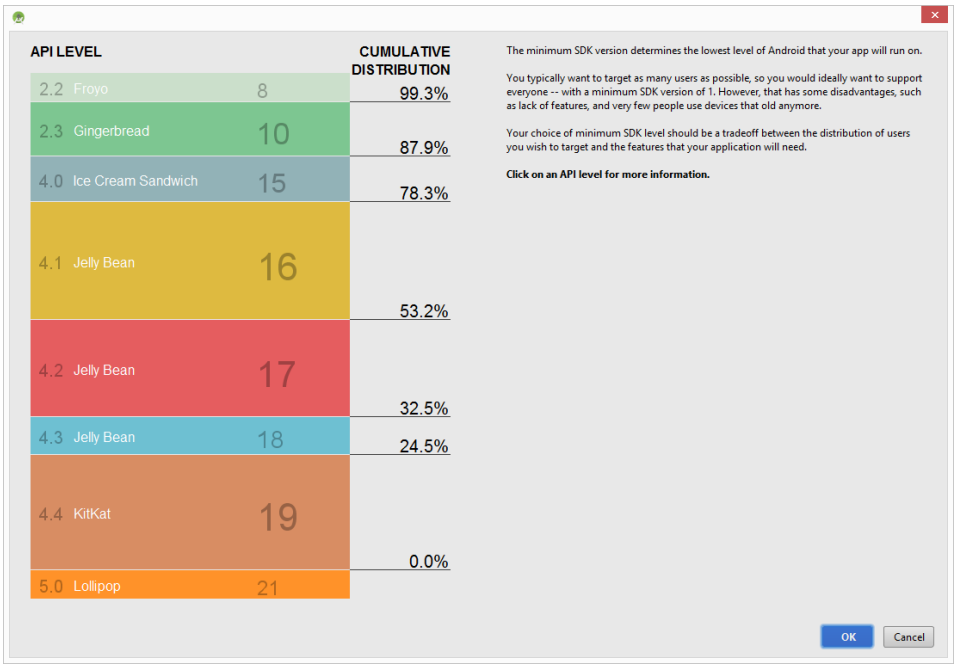

Figure 3-3

Since the project is not intended for Google TV, Google Glass or wearable devices, leave the remaining options disabled before clicking *Next*.

3.3 Creating an Activity

The next step is to define the type of initial activity that is to be created for the application. A range of different activity types is available when developing Android applications. The *Master/Detail Flow* option will be covered in a later chapter. For the purposes of this example, however, simply select the option to create a *Blank Activity.*

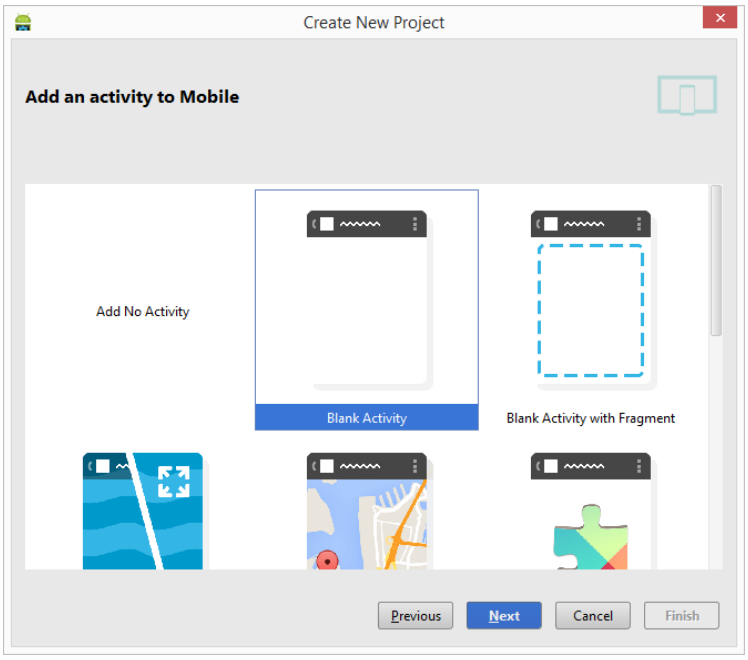

Figure 3-4

http://freepdf-books.com

With the Blank Activity option selected, click *Next.* On the final screen (Figure 3-5) name the activity and title *AndroidSampleActivity*. The activity will consist of a single user interface screen layout which, for the purposes of this example, should be named *activity_android_sample* as shown in Figure 3-5 and with a menu resource named *menu_android_sample*:

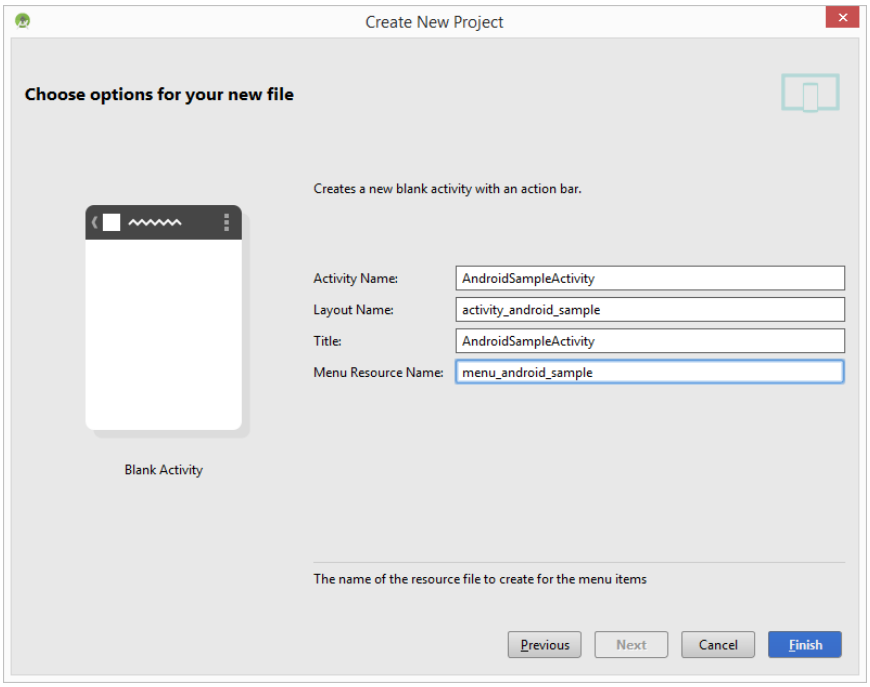

Figure 3-5

Finally, click on *Finish* to initiate the project creation process.

3.4 Modifying the Example Application

At this point, Android Studio has created a minimal example application project and opened the main window.

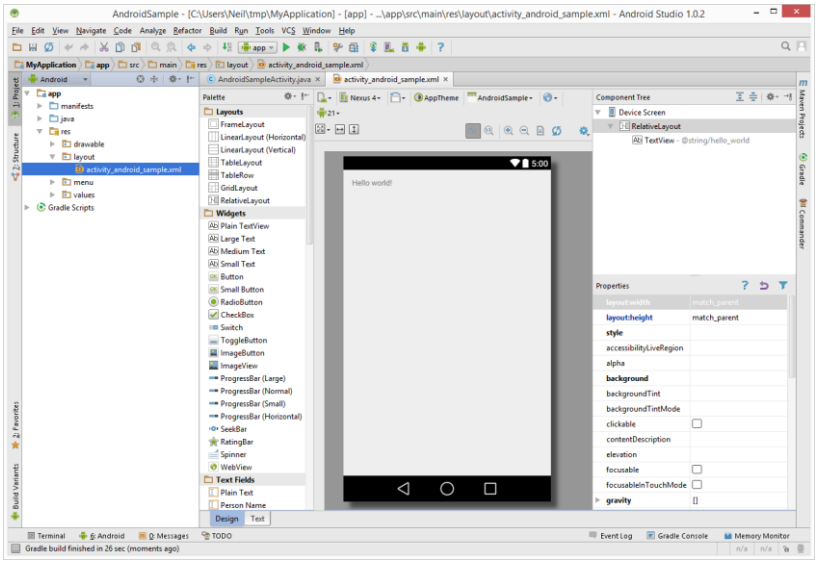

Figure 3-6

The newly created project and references to associated files are listed in the *Project* tool window located on the left hand side of the main project window. The Project tool window has a number of modes in which information can be displayed. By default,

http://freepdf-books.com

this panel will be in *Android* mode. This setting is controlled by the drop down menu at the top of the panel as highlighted in Figure 3-6. If the panel is not currently in Android mode, click on this menu and switch to Android mode:

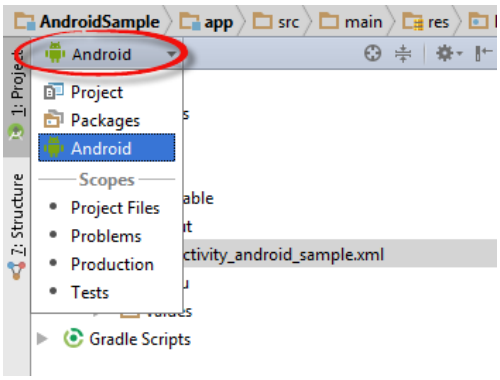

Figure 3-7

The example project created for us when we selected the option to create an activity consists of a user interface containing a label that will read “Hello World” when the application is executed.

The next step in this tutorial is to modify the user interface of our application so that it displays a larger text view object with a different message to the one provided for us by Android Studio.

The user interface design for our activity is stored in a file named *activity_android_sample.xml* which, in turn, is located under *app -> res -> layout* in the project file hierarchy. Using the Project tool window, locate this file as illustrated in Figure 3-8:

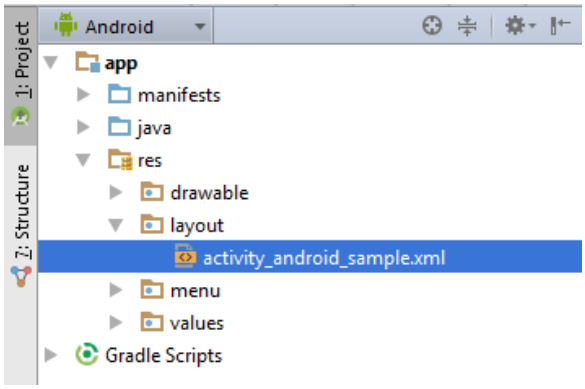

Figure 3-8

Once located, double click on the file to load it into the User Interface Designer tool which will appear in the center panel of the Android Studio main window:

http://freepdf-books.com

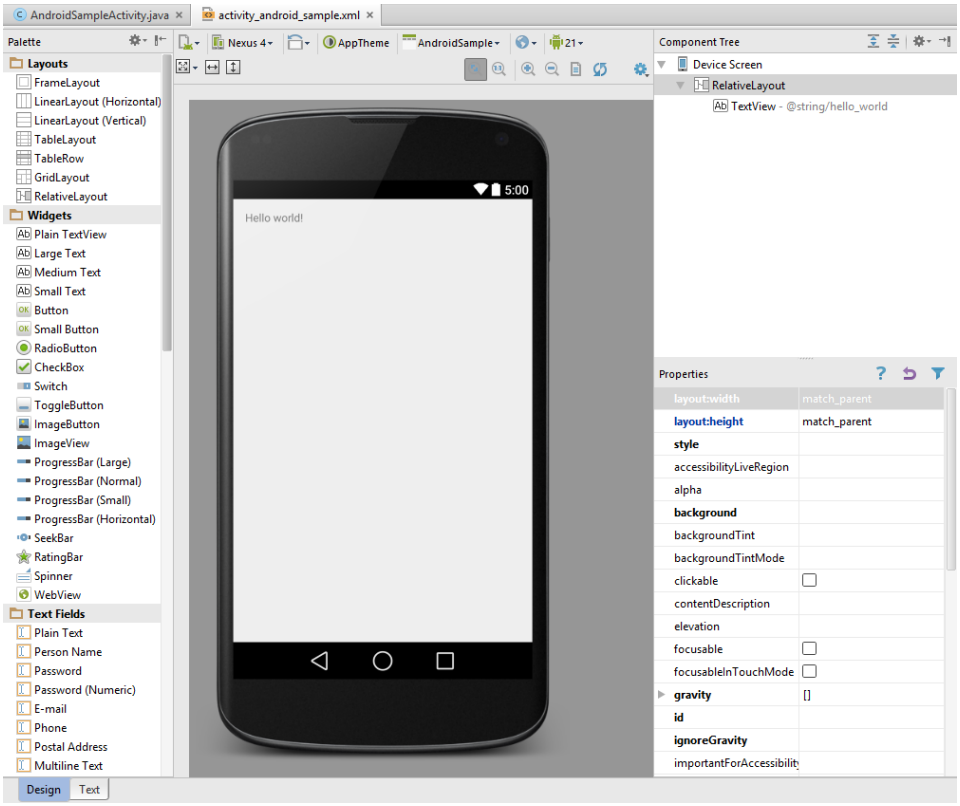

Figure 3-9

In the toolbar across the top of Designer window is a menu currently set to *Nexus 4* which is reflected in the visual representation of the device within the Designer panel. A wide range of other device options are available for selection by clicking on this menu.

To change the orientation of the device representation between landscape and portrait simply use the drop down menu immediately to the right of the device selection menu showing the icon.

As can be seen in the device screen, the layout already includes a label that displays a Hello World! message. Running down the left hand side of the panel is a palette containing different categories of user interface components that may be used to construct a user interface, such as buttons, labels and text fields. It should be noted, however, that not all user interface components are obviously visible to the user. One such category consists of *layouts*. Android supports a variety of different layouts that provide different levels of control over how visual user interface components are positioned and managed on the screen. Though it is difficult to tell from looking at the visual representation of the user interface, the current design has been created using a RelativeLayout. This can be confirmed by reviewing the information in the *Component Tree* panel which, by default, is located in the upper right hand corner of the Designer panel and is shown in Figure 3-10:

http://freepdf-books.com

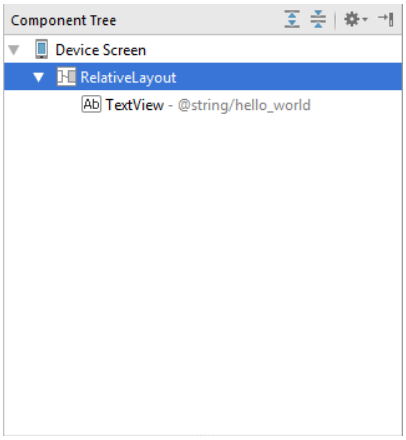

Figure 3-10

As we can see from the component tree hierarchy, the user interface consists of a RelativeLayout parent with a single child in the form of a TextView object.

The first step in modifying the application is to delete the TextView component from the design. Begin by clicking on the TextView object within the user interface view so that it appears with a blue border around it. Once selected, press the Delete key on the keyboard to remove the object from the layout.

In the Palette panel, locate the *Widgets* category. Click and drag the *Large Text* object and drop it in the center of the user interface design when the green marker lines appear to indicate the center of the display:

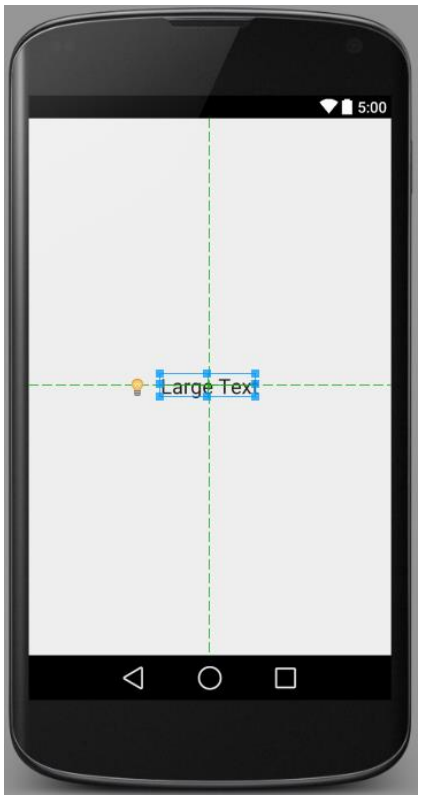

Figure 3-11

The Android Studio Designer tool also provides an alternative to dragging and dropping components from the palette on to the design layout. Components may also be added by selecting the required object from the palette and then simply clicking on the layout at the location where the component is to be placed.

http://freepdf-books.com

The next step is to change the text that is currently displayed by the TextView component. Double click on the object in the design layout to display the text and id editing panel as illustrated in Figure 3-12. Within the panel, change the text property from “Large Text” to “Welcome to Android Studio”.

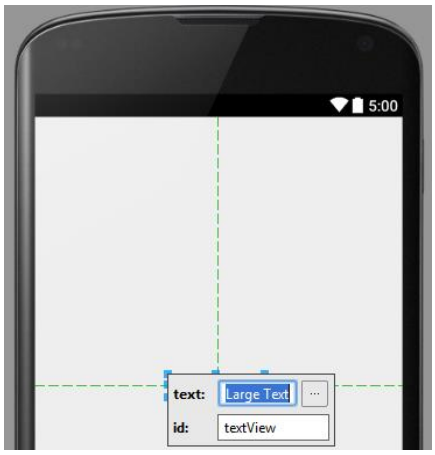

Figure 3-12

At this point it is important to explain the light bulb next to the TextView object in the layout. This indicates a possible problem and provides some recommended solutions. Clicking on the icon in this instance informs us that the problem is as follows:

```
[I18N] Hardcoded string “Welcome to Android Studio”, should use @string resource
```

This I18N message is informing us that a potential issue exists with regard to the future internationalization of the project (“I18N” comes from the fact that the word “internationalization” begins with an “I”, ends with an “N” and has 18 letters in between). The warning is reminding us that when developing Android applications, attributes and values such as text strings should be stored in the form of *resources* wherever possible. Doing so enables changes to the appearance of the application to be made by modifying resource files instead of changing the application source code. This can be especially valuable when translating a user interface to a different spoken language. If all of the text in a user interface is contained in a single resource file, for example, that file can be given to a translator who will then perform the translation work and return the translated file for inclusion in the application. This enables multiple languages to be targeted without the necessity for any source code changes to be made. In this instance, we are going to create a new resource named *welcomestring* and assign to it the string “Welcome to Android Studio”.

Click on the arrow to the right of the warning message to display the menu of possible solutions (Figure 3-13).

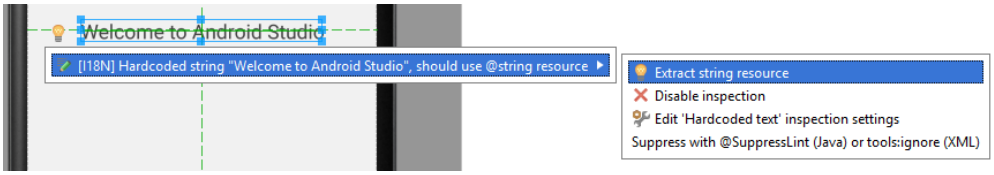

Figure 3-13

From the menu, select the *Extract string resource* option to display the *Extract Resource* dialog. In this dialog, enter *welcomestring* into the *Resource name:* field before clicking on *OK.* The string is now stored as a resource in the *app -> res -> values -> strings.xml* file.

3.5 Reviewing the Layout and Resource Files

Before moving on to the next chapter, we are going to look at some of the internal aspects of user interface design and resource handling. In the previous section, we made some changes to the user interface by modifying the *activity_android_sample.xml*

http://freepdf-books.com

file using the UI Designer tool. In fact, all that the Designer was doing was providing a user-friendly way to edit the underlying XML content of the file. In practice, there is no reason why you cannot modify the XML directly in order to make user interface changes and, in some instances, this may actually be quicker than using the Designer tool. At the bottom of the Designer panel are two tabs labeled *Design* and *Text* respectively. To switch to the XML view simply select the *Text* tab as shown in Figure 3-14:

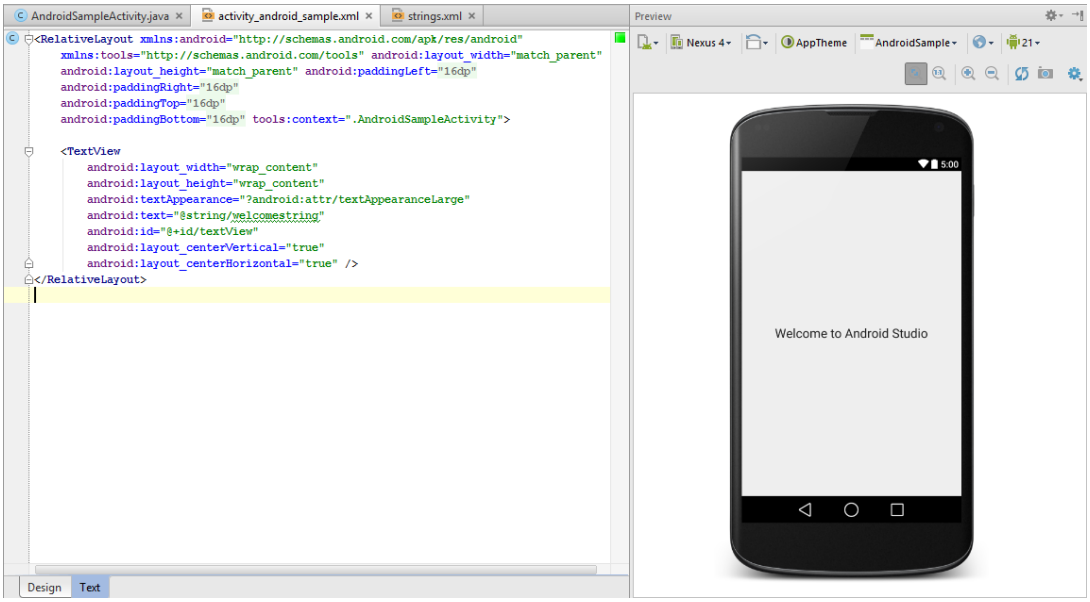

Figure 3-14

As can be seen from the structure of the XML file, the user interface consists of the RelativeLayout component, which in turn, is the parent of the TextView object. We can also see that the *text* property of the TextView is set to our *welcomestring* resource. Although varying in complexity and content, all user interface layouts are structured in this hierarchical, XML based way.

One of the more powerful features of Android Studio can be found to the right hand side of the XML editing panel. This is the Preview panel and shows the current visual state of the layout. As changes are made to the XML layout, these will be reflected in the preview panel. To see this in action, modify the XML layout to change the background color of the RelativeLayout to a shade of red as follows:

```
<RelativeLayout xmlns:android="http://schemas.android.com/apk/res/android"
    xmlns:tools="http://schemas.android.com/tools"
    android:layout_width="match_parent"
    android:layout_height="match_parent"
    android:paddingLeft="@dimen/activity_horizontal_margin"
    android:paddingRight="@dimen/activity_horizontal_margin"
    android:paddingTop="@dimen/activity_vertical_margin"
    android:paddingBottom="@dimen/activity_vertical_margin"
    tools:context=".AndroidSampleActivity"
    android:background="#ff2438">

    <TextView
        android:layout_width="wrap_content"
        android:layout_height="wrap_content"
        android:textAppearance="?android:attr/textAppearanceLarge"
        android:text="@string/welcomestring"
        android:id="@+id/textView"
        android:layout_centerVertical="true"
        android:layout_centerHorizontal="true" />
```

http://freepdf-books.com

```
</RelativeLayout>
```

Note that the color of the preview changes in real-time to match the new setting in the XML file. Note also that a small red square appears in the left hand margin (also referred to as the *gutter*) of the XML editor next to the line containing the color setting. This is a visual cue to the fact that the color red has been set on a property. Change the color value to #a0ff28 and note that both the small square in the margin and the preview change to green.

Finally, use the Project view to locate the *app -> res -> values -> strings.xml* file and double click on it to load it into the editor. Currently the XML should read as follows:

```
<?xml version="1.0" encoding="utf-8"?>
<resources>

    <string name="app_name">AndroidSample</string>
    <string name="hello_world">Hello world!</string>
    <string name="action_settings">Settings</string>
    <string name="welcomestring">Welcome to Android Studio</string>

</resources>
```

As a demonstration of resources in action, change the string value currently assigned to the *welcomestring* resource and then return to the Designer by selecting the tab for the layout file in the editor panel. Note that the layout has picked up the new resource value for the welcome string.

There is also a quick way to access the value of a resource referenced in an XML file. With the Designer tool in Text mode, click on the "@string/welcomestring" property setting so that it highlights and then press Ctrl+B on the keyboard. Android Studio will subsequently open the *strings.xml* file and take you to the line in that file where this resource is declared. Use this opportunity to revert the string resource back to the original "Welcome to Android Studio" text.

3.6 Previewing the Layout

So far in this chapter, the layout has only been previewed on a representation of the Nexus 4 device. As previously discussed, the layout can be tested for other devices by making selections from the device menu in the toolbar across the top edge of the Designer panel. Another useful option provided by this menu is *Preview All Screen Sizes* which, when selected, shows the layout in all currently configured device configurations as demonstrated in Figure 3-15:

http://freepdf-books.com

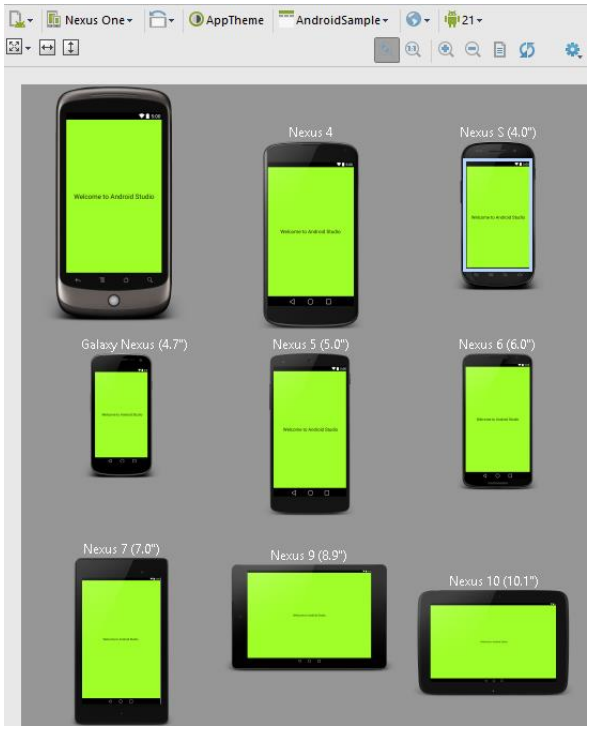

Figure 3-15

To revert to a single preview layout, select the device menu once again, this time choosing the *Remove Previews* option.

3.7 Summary

Whilst not excessively complex, a number of steps are involved in setting up an Android development environment. Having performed those steps, it is worth working through a simple example to make sure the environment is correctly installed and configured. In this chapter, we have created a simple application and then used the Android Studio UI Designer to modify the user interface layout. In doing so, we explored the importance of using resources wherever possible, particularly in the case of string values, and briefly touched on the topic of layouts. Finally, we looked at the underlying XML that is used to store the user interface designs of Android applications.

Whilst it is useful to be able to preview a layout from within the Android Studio Designer tool, there is no substitute for testing an application by compiling and running it. In a later chapter entitled *Creating an Android Virtual Device (AVD) in Android Studio*, the steps necessary to set up an emulator for testing purposes will be covered in detail. Before running the application, however, the next chapter will take a small detour to provide a guided tour of the Android Studio user interface.

http://freepdf-books.com

http://freepdf-books.com

Chapter 4

4. A Tour of the Android Studio User Interface

Whilst it is tempting to plunge into running the example application created in the previous chapter, doing so involves using aspects of the Android Studio user interface which are best described in advance.

Android Studio is a powerful and feature rich development environment that is, to a large extent, intuitive to use. That being said, taking the time now to gain familiarity with the layout and organization of the Android Studio user interface will considerably shorten the learning curve in later chapters of the book. With this in mind, this chapter will provide an initial overview of the various areas and components that make up the Android Studio environment.

4.1 The Welcome Screen

The welcome screen (Figure 4-1) is displayed any time that Android Studio is running with no projects currently open (open projects can be closed at any time by selecting the *File -> Close Project* menu option). If Android Studio was previously exited while a project was still open, the tool will by-pass the welcome screen next time it is launched, automatically opening the previously active project.

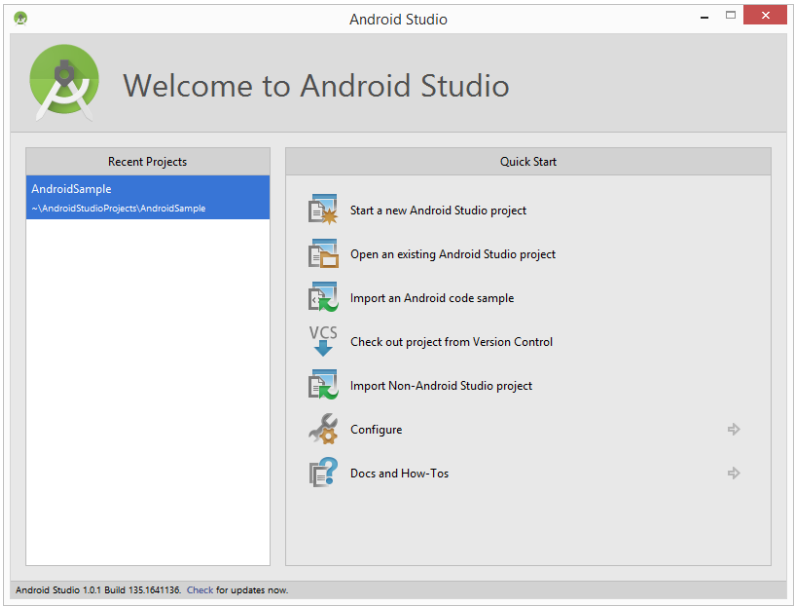

Figure 4-1

In addition to a list of recent projects, the Quick Start menu provides a range of options for performing tasks such as opening, creating and importing projects along with access to projects currently under version control. In addition, the *Configure* option provides access to the SDK Manager along with a vast array of settings and configuration options. A review of these options will quickly reveal that there is almost no aspect of Android Studio that cannot be configured and tailored to your specific needs.

Finally, the status bar along the bottom edge of the window provides information about the version of Android Studio currently running, along with a link to check if updates are available for download.

http://freepdf-books.com

4.2 The Main Window

When a new project is created, or an existing one opened, the Android Studio *main window* will appear. When multiple projects are open simultaneously, each will be assigned its own main window. The precise configuration of the window will vary depending on which tools and panels were displayed the last time the project was open, but will typically resemble that of Figure 4-2.

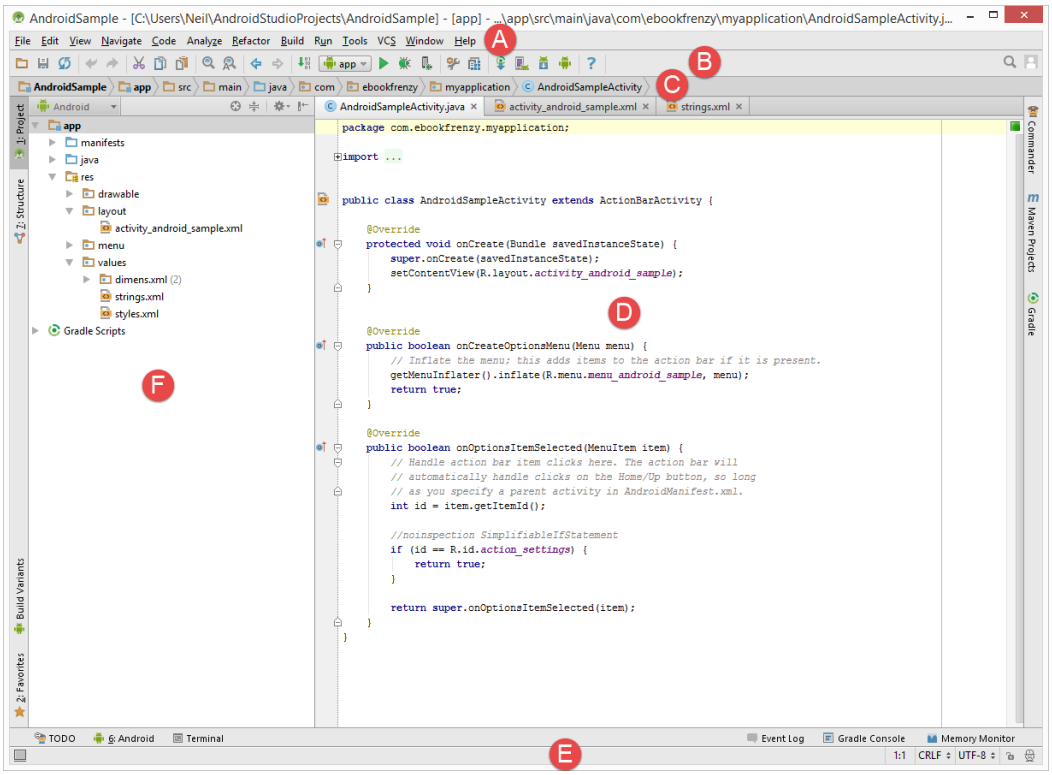

Figure 4-2

The various elements of the main window can be summarized as follows:

A – Menu Bar – Contains a range of menus for performing tasks within the Android Studio environment.

B – Toolbar – A selection of shortcuts to frequently performed actions. The toolbar buttons provide quicker access to a select group of menu bar actions. The toolbar can be customized by right-clicking on the bar and selecting the *Customize Menus and Toolbars…* menu option.

C – Navigation Bar – The navigation bar provides a convenient way to move around the files and folders that make up the project. Clicking on an element in the navigation bar will drop down a menu listing the subfolders and files at that location ready for selection. This provides an alternative to the Project tool window.

D – Editor Window – The editor window displays the content of the file on which the developer is currently working. What gets displayed in this location, however, is subject to context. When editing code, for example, the code editor will appear. When working on a user interface layout file, on the other hand, the user interface Designer tool will appear. When multiple files are open, each file is represented by a tab located along the top edge of the editor as shown in Figure 4-3.

http://freepdf-books.com

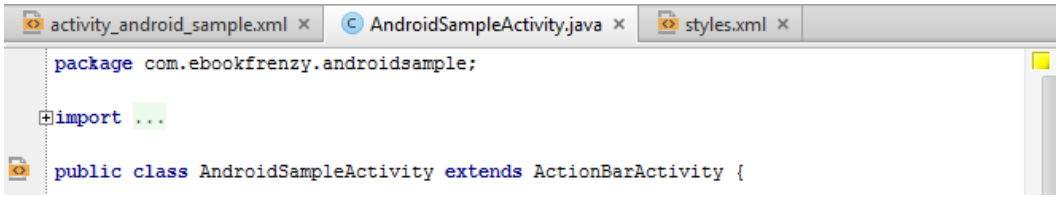

Figure 4-3

E – Status Bar – The status bar displays informational messages about the project and the activities of Android Studio together with the tools menu button located in the far left corner. Hovering over items in the status bar will provide a description of that field. Many fields are interactive, allowing the user to click to perform tasks or obtain more detailed status information.

F – Project Tool Window – The project tool window provides a hierarchical overview of the project file structure allowing navigation to specific files and folders to be performed. The drop-down menu in the toolbar can be used to display the project in a number of different ways. The default setting is the *Android* view which is the mode primarily used in the remainder of this book.

The project tool window is just one of a number of tool windows available within the Android Studio environment.

4.3 The Tool Windows

In addition to the project view tool window, Android Studio also includes a number of other windows which, when enabled, are displayed along the bottom and sides of the main window. The tool window quick access menu can be accessed by hovering the mouse pointer over the button located in the far left hand corner of the status bar (Figure 4-4) without clicking the mouse button.

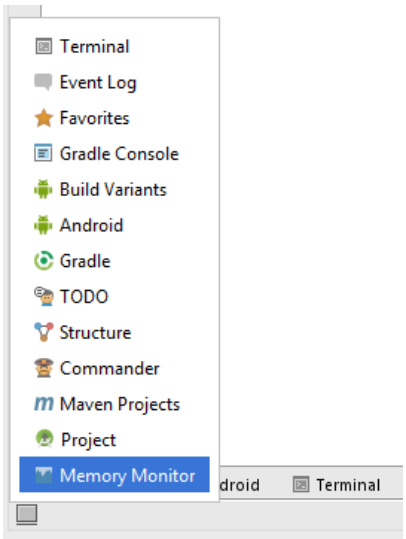

Figure 4-4

Selecting an item from the quick access menu will cause the corresponding tool window to appear within the main window.

Alternatively, a set of *tool window bars* can be displayed by clicking on the quick access menu icon in the status bar. These bars appear along the left, right and bottom edges of the main window (as indicated by the arrows in Figure 4-5) and contain buttons for showing and hiding each of the tool windows. When the tool window bars are displayed, a second click on the button in the status bar will hide them.

http://freepdf-books.com

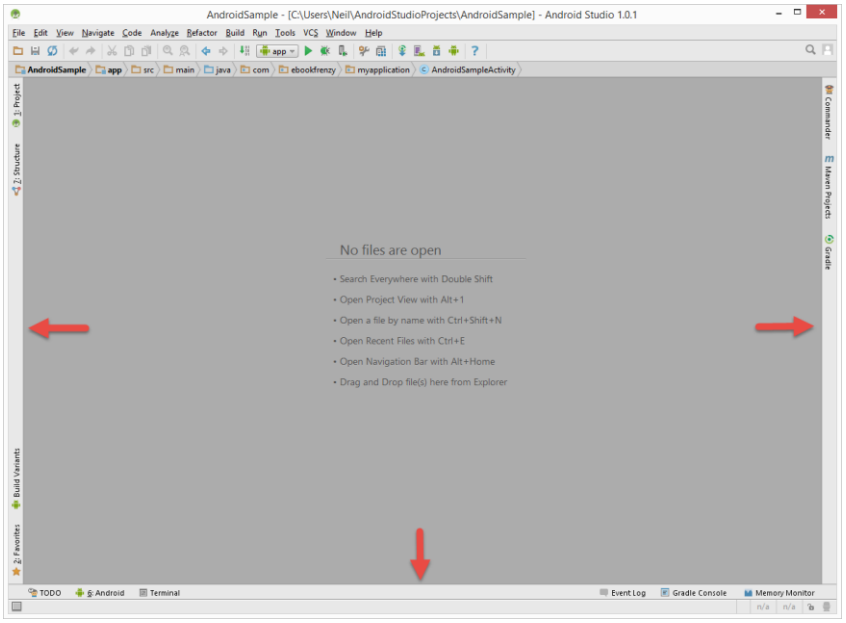

Figure 4-5

Clicking on a button will display the corresponding tool window whilst a second click will hide the window. Buttons prefixed with a number (for example 1: Project) indicate that the tool window may also be displayed by pressing the Alt key on the keyboard (or the Command key for Mac OS X) together with the corresponding number.

The location of a button in a tool window bar indicates the side of the window against which the window will appear when displayed. These positions can be changed by clicking and dragging the buttons to different locations in other window tool bars.

Each tool window has its own toolbar along the top edge. The buttons within these toolbars vary from one tool to the next, though all tool windows contain a settings option, represented by the cog icon, which allows various aspects of the window to be changed. Figure 4-6 shows the settings menu for the project view tool window. Options are available, for example, to undock a window and to allow it to float outside of the boundaries of the Android Studio main window.

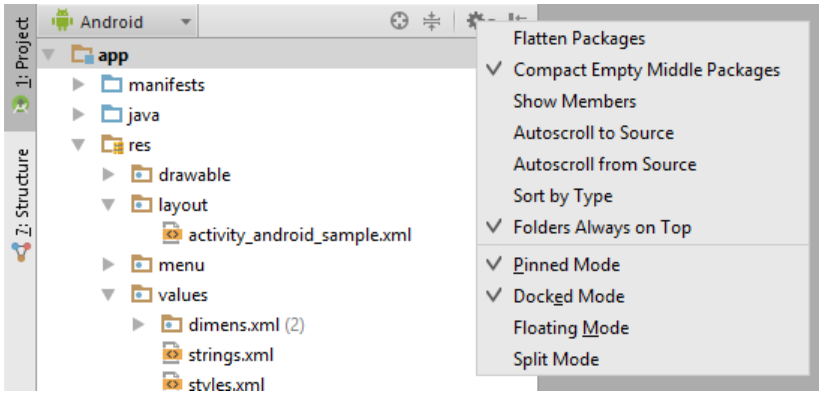

Figure 4-6

All of the windows also include a far right button on the toolbar providing an additional way to hide the tool window from view. A search of the items within a tool window can be performed simply by giving that window focus by clicking in it and then typing the search term (for example the name of a file in the Project tool window). A search box will appear in the window's tool bar and items matching the search highlighted.

Android Studio offers a wide range of window tool windows, the most commonly used of which are as follows:

http://freepdf-books.com

Project – The project view provides an overview of the file structure that makes up the project allowing for quick navigation between files. Generally, double clicking on a file in the project view will cause that file to be loaded into the appropriate editing tool.

Structure – The structure tool provides a high level view of the structure of the source file currently displayed in the editor. This information includes a list of items such as classes, methods and variables in the file. Selecting an item from the structure list will take you to that location in the source file in the editor window.

Favorites – A variety of project items can be added to the favorites list. Right-clicking on a file in the project view, for example, provides access to an *Add to Favorites* menu option. Similarly, a method in a source file can be added as a favorite by right-clicking on it in the Structure tool window. Anything added to a Favorites list can be accessed through this Favorites tool window.

Build Variants – The build variants tool window provides a quick way to configure different build targets for the current application project (for example different builds for debugging and release versions of the application, or multiple builds to target different device categories).

TODO – As the name suggests, this tool provides a place to review items that have yet to be completed on the project. Android Studio compiles this list by scanning the source files that make up the project to look for comments that match specified TODO patterns. These patterns can be reviewed and changed by selecting the *File -> Settings…* menu option and navigating to the *TODO* page listed under *IDE Settings*.

Messages – The messages tool window records output from the Gradle build system (Gradle is the underlying system used by Android Studio for building the various parts of projects into runnable applications) and can be useful for identifying the causes of build problems when compiling application projects.

Android – The Android tool window provides access to the Android debugging system. Within this window tasks such as monitoring log output from a running application, taking screenshots and videos of the application, stopping a process and performing basic debugging tasks can be performed.

Terminal – Provides access to a terminal window on the system on which Android Studio is running. On Windows systems this is the Command Prompt interface, whilst on Linux and Mac OS X systems this takes the form of a Terminal prompt.

Run – The run tool window becomes available when an application is currently running and provides a view of the results of the run together with options to stop or restart a running process. If an application is failing to install and run on a device or emulator, this window will typically provide diagnostic information relating to the problem.

Event Log – The event log window displays messages relating to events and activities performed within Android Studio. The successful build of a project, for example, or the fact that an application is now running will be reported within this window tool.

Gradle Console – The Gradle console is used to display all output from the Gradle system as projects are built from within Android Studio. This will include information about the success or otherwise of the build process together with details of any errors or warnings.

Maven Projects – Maven is a project management and build system designed to ease the development of complex Java based projects and overlaps in many areas with the functionality provided by Gradle. Google has chosen Gradle as the underlying build system for Android development, so unless you are already familiar with Maven or have existing Maven projects to import, your time will be better spent learning and adopting Gradle for your projects. The Maven projects tool window can be used to add, manage and import Maven based projects within Android Studio.

Gradle – The Gradle tool window provides a view onto the Gradle tasks that make up the project build configuration. The window lists the tasks that are involved in compiling the various elements of the project into an executable application. Right-

http://freepdf-books.com

click on a top level Gradle task and select the *Open Gradle Config* menu option to load the Gradle build file for the current project into the editor. Gradle will be covered in greater detail later in this book.

Commander – The Commander window tool can best be described as a combination of the Project and Structure tool windows, allowing the file hierarchy of the project to be traversed and for the various elements that make up classes to be inspected and loaded into the editor or designer windows.

Memory Monitor – Connects to running Android applications and monitors memory usage statistics in the form of a real-time graph.

Designer – Available when the UI Designer is active, this tool window provides access to the designer's Component Tree and Properties panels.

4.4 Android Studio Keyboard Shortcuts

Android Studio includes an abundance of keyboard shortcuts designed to save time when performing common tasks. A full keyboard shortcut keymap listing can be viewed and printed from within the Android Studio project window by selecting the *Help -> Default Keymap Reference* menu option.

4.5 Switcher and Recent Files Navigation

Another useful mechanism for navigating within the Android Studio main window involves the use of the *Switcher*. Accessed via the *Ctrl-Tab* keyboard shortcut, the switcher appears as a panel listing both the tool windows and currently open files (Figure 4-7).

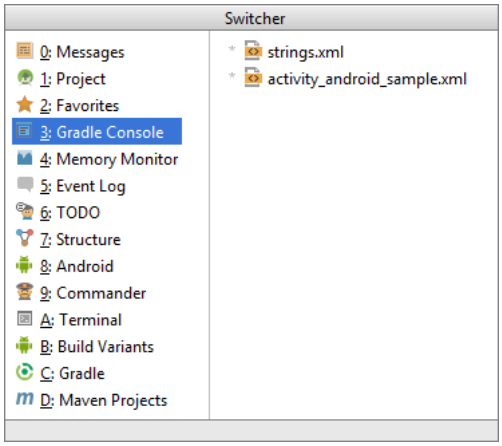

Figure 4-7

Once displayed, the switcher will remain visible for as long as the Ctrl key remains depressed. Repeatedly tapping the Tab key whilst holding down the Ctrl key will cycle through the various selection options, whilst releasing the Ctrl key causes the currently highlighted item to be selected and displayed within the main window.

In addition to the switcher, navigation to recently opened files is provided by the Recent Files panel (Figure 4-8). This can be accessed using the Ctrl-E keyboard shortcut (Cmd-E on Mac OS X). Once displayed, either the mouse pointer can be used to select an option or, alternatively, the keyboard arrow keys can be used to scroll through the file name and tool window options. Pressing the Enter key will select the currently highlighted item.

http://freepdf-books.com

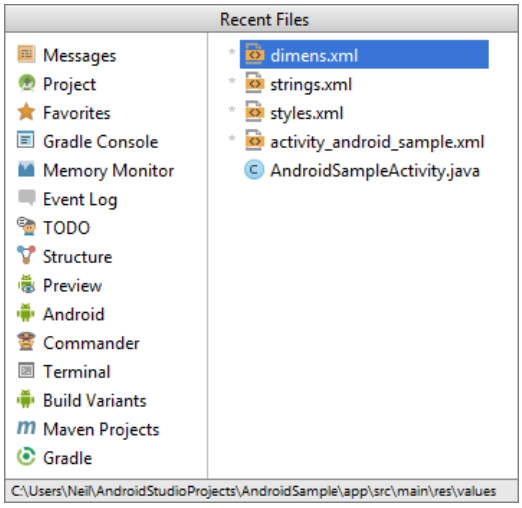

Figure 4-8

4.6 Changing the Android Studio Theme

The overall theme of the Android Studio environment may be changed either from the welcome screen using the *Configure -> Settings* option, or via the *File -> Settings…* menu option of the main window.

Once the settings dialog is displayed, select the *Appearance* option in the left hand panel and then change the setting of the *Theme* menu before clicking on the *Apply* button. The themes currently available consist of IntelliJ, Windows and Darcula. Figure 4-9 shows an example of the main window with the Darcula theme selected:

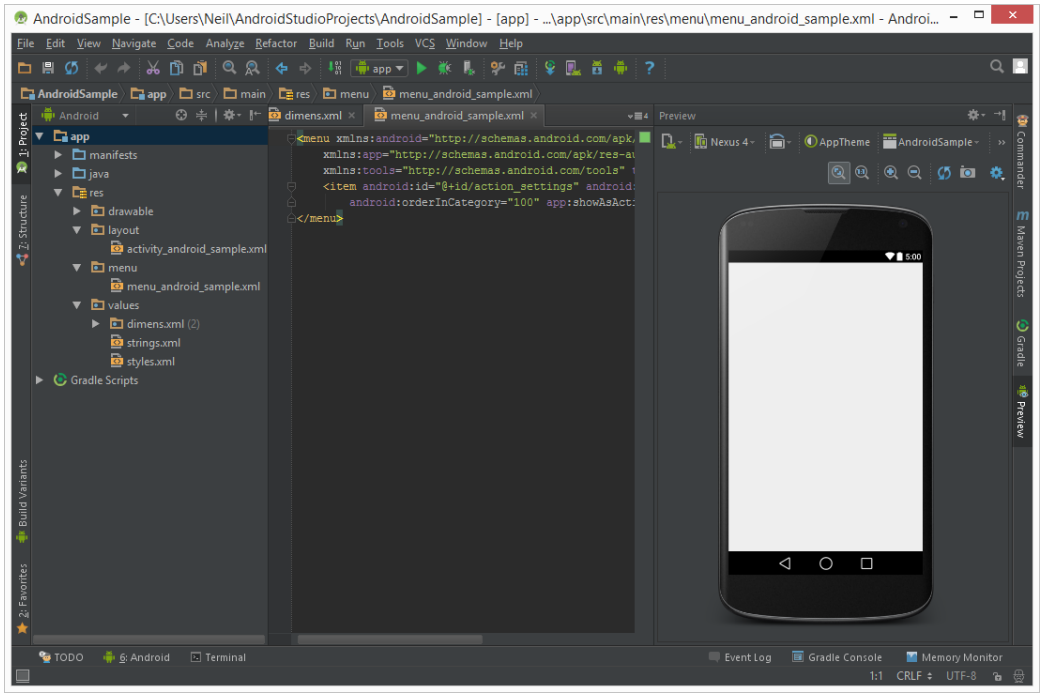

Figure 4-9

4.7 Summary

The primary elements of the Android Studio environment consist of the welcome screen and main window. Each open project is assigned its own main window which, in turn, consists of a menu bar, toolbar, editing and design area, status bar and a

http://freepdf-books.com

collection of tool windows. Tool windows appear on the sides and bottom edges of the main window and can be accessed either using the quick access menu located in the status bar, or via the optional tool window bars.

There are very few actions within Android Studio which cannot be triggered via a keyboard shortcut. A keymap of default keyboard shortcuts can be accessed at any time from within the Android Studio main window.

http://freepdf-books.com

Chapter 5

5. Creating an Android Virtual Device (AVD) in Android Studio

In the course of developing Android apps in Android Studio it will be necessary to compile and run an application multiple times. An Android application may be tested by installing and running it either on a physical device or in an *Android Virtual Device (AVD)* emulator environment. Before an AVD can be used, it must first be created and configured to match the specification of a particular device model. The goal of this chapter, therefore, is to work through the steps involved in creating such a virtual device using the Nexus 7 tablet as a reference example.

5.1 About Android Virtual Devices

AVDs are essentially emulators that allow Android applications to be tested without the necessity to install the application on a physical Android based device. An AVD may be configured to emulate a variety of hardware features including options such as screen size, memory capacity and the presence or otherwise of features such as a camera, GPS navigation support or an accelerometer. As part of the standard Android Studio installation, a number of emulator templates are installed allowing AVDs to be configured for a range of different devices. Additional templates may be loaded or custom configurations created to match any physical Android device by specifying properties such as processor type, memory capacity and the size and pixel density of the screen. Check the online developer documentation for your device to find out if emulator definitions are available for download and installation into the AVD environment.

When launched, an AVD will appear as a window containing an emulated Android device environment. Figure 5-1, for example, shows an AVD session configured to emulate the Google Nexus 7 device.

New AVDs are created and managed using the Android Virtual Device Manager, which may be used either in command-line mode or with a more user-friendly graphical user interface.

http://freepdf-books.com

Figure 5-1

5.2 Creating a New AVD

In order to test the behavior of an application, it will be necessary to create an AVD for a specific Android device configuration.

To create a new AVD, the first step is to launch the AVD Manager. This can be achieved from within the Android Studio environment by selecting the *Tools -> Android -> AVD Manager* menu option from within the main window. Alternatively, the tool may be launched from a terminal or command-line prompt using the following command:

```
android avd
```

Once launched, the tool will appear as outlined in Figure 5-2. Assuming a new Android SDK installation, no AVDs will currently be listed:

http://freepdf-books.com

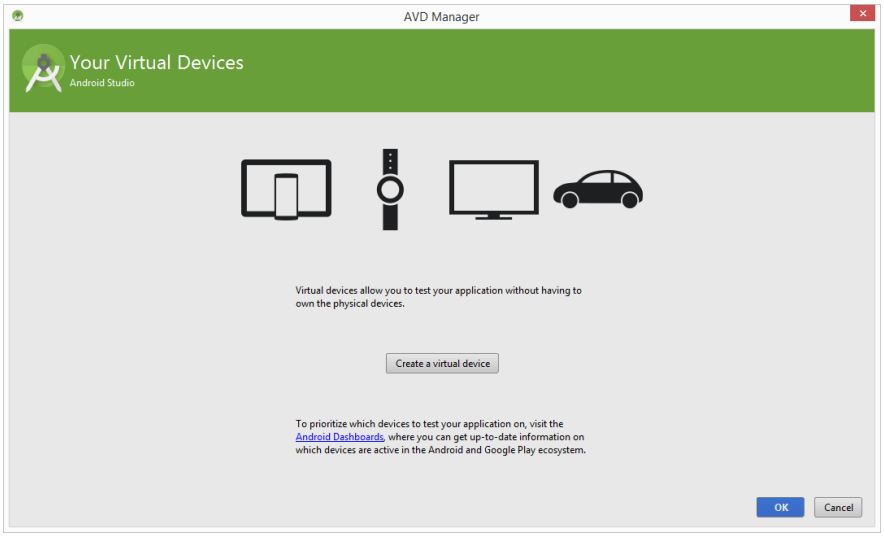

Figure 5-2

Begin the AVD creation process by clicking on the *Create a virtual device* button in order to invoke the *Virtual Device Configuration* dialog:

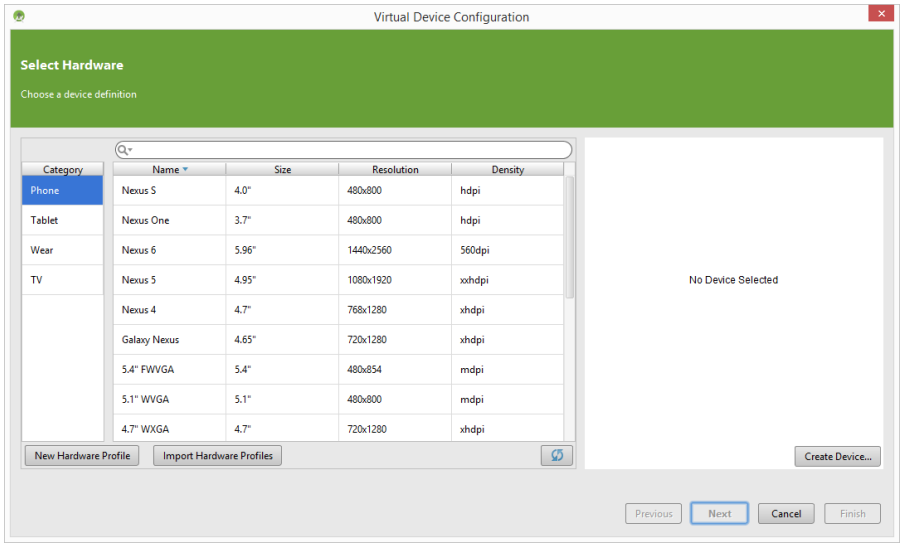

Figure 5-3

Within the dialog, perform the following steps to create a first generation Nexus 7 compatible emulator:

1. From the *Category* panel, select the *Tablet* option to display the list of available Android tablet AVD templates.
2. Select the *Nexus 7 (2012)* device option and click *Next*.
3. On the System Image screen, select the latest version of Android (at time of writing this is Android 5.0.1, Lollipop API level 21) for the *armeabi-v7a* ABI. Click *Next* to proceed.
4. Enter a descriptive name (for example *Nexus 7*) into the name field.
5. Click *Finish* to create the AVD.

With the AVD created, the AVD Manager may now be closed. If future modifications to the AVD are necessary, simply re-open the AVD Manager, select the AVD from the list and click on the pencil icon in the *Actions* column of the device row in the AVD Manager.

http://freepdf-books.com

5.3 Starting the Emulator

To perform a test run of the newly created AVD emulator, simply select the emulator from the AVD Manager and click on the launch button (the green triangle in the Actions column) followed by *Launch* in the resulting *Launch Options* dialog. The emulator will appear in a new window and, after a short period of time, the "android" logo will appear in the center of the screen. The first time the emulator is run, it can take up to 10 minutes for the emulator to fully load and start. On subsequent invocations, this will typically reduce to a few minutes. In the event that the startup time on your system is considerable, do not hesitate to leave the emulator running. The system will detect that it is already running and attach to it when applications are launched, thereby saving considerable amounts of startup time.

Another option when using the emulator is to enable the *Snapshot* option in the AVD settings screen. This option, which can only be used when the *Use Host GPU* option is disabled, enables the state of an AVD instance to be saved and reloaded next time it is launched. This can result in an emulator startup time of just a few seconds.

To enable snapshots, edit the settings for the AVD configuration and click on the *Show Advanced Settings* button. In the *Emulated Performance* section of the advanced settings panel, disable the *Use Host GPU* option and enable the *Store a snapshot for faster startup* as outlined in Figure 5-4:

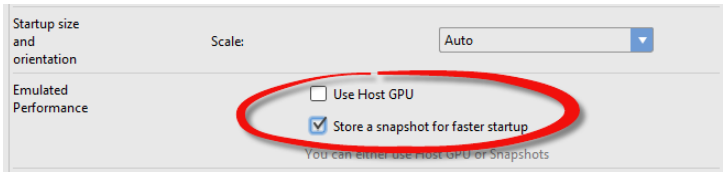

Figure 5-4

To save time in the next section of this chapter, leave the emulator running before proceeding.

5.4 Running the Application in the AVD

With an AVD emulator configured, the example AndroidSample application created in the earlier chapter now can be compiled and run. With the AndroidSample project loaded into Android Studio, simply click on the run button represented by a green triangle located in the Android Studio toolbar as shown in Figure 5-5 below, select the *Run -> Run…* menu option or use the Shift+F10 keyboard shortcut:

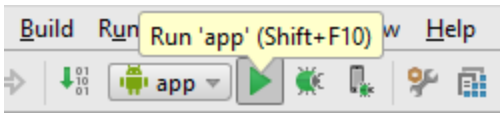

Figure 5-5

By default, Android Studio will respond to the run request by displaying the *Choose Device* dialog. This provides the option to execute the application on an AVD instance that is already running, or to launch a new AVD session specifically for this application. Figure 5-6 lists the previously created Nexus7 AVD as a running device as a result of the steps performed in the preceding section. With this device selected in the dialog, click on *OK* to install and run the application on the emulator.

http://freepdf-books.com

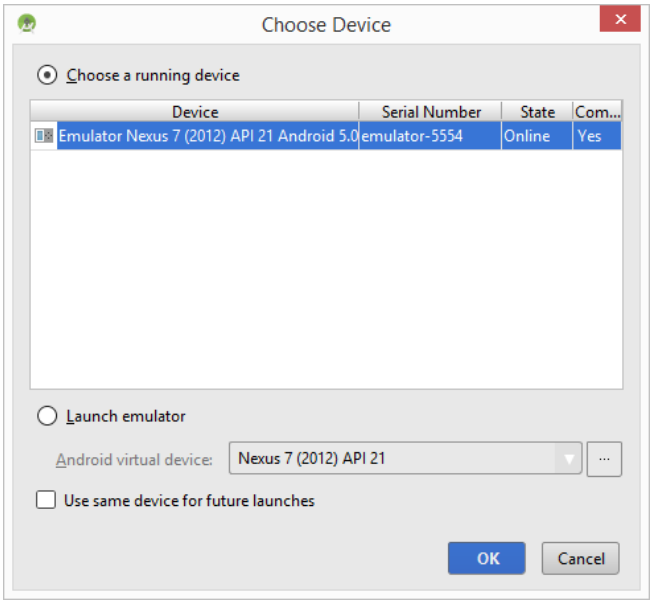

Figure 5-6

Once the application is installed and running, the user interface for the AndroidSampleActivity class will appear within the emulator:

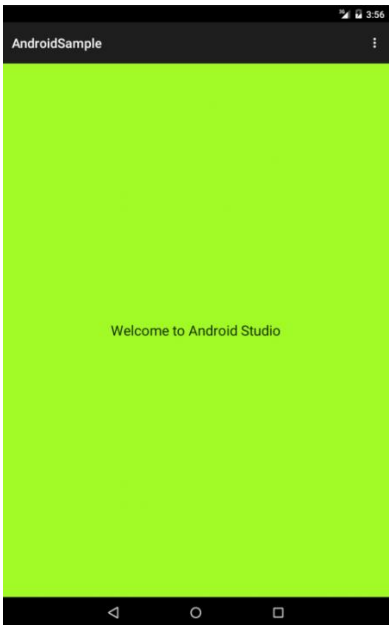

Figure 5-7

In the event that the activity does not automatically launch, check to see if the launch icon has appeared among the apps on the emulator. If it has, simply click on it to launch the application. Once the run process begins, the Run and Android tool windows will become available. The Run tool window will display diagnostic information as the application package is installed and launched. Figure 5-8 shows the Run tool window output from a successful application launch:

http://freepdf-books.com

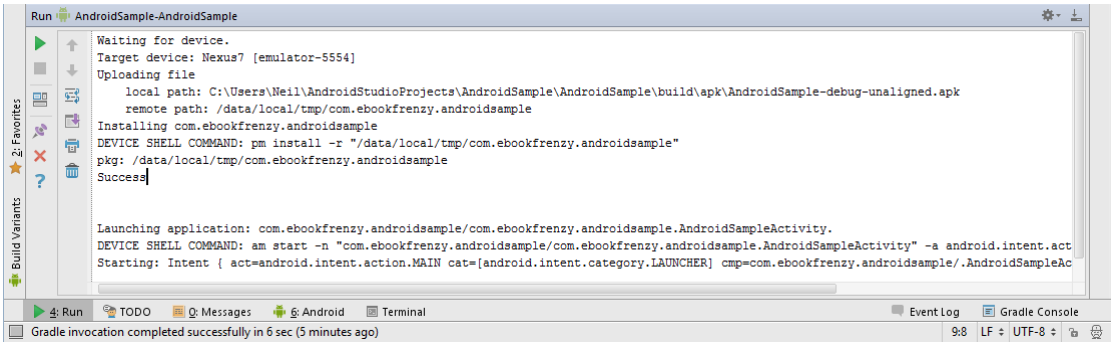

Figure 5-8

If problems are encountered during the launch process, the Run tool will provide information that will hopefully help to isolate the cause of the problem.

Assuming that the application loads into the emulator and runs as expected, we have safely verified that the Android development environment is correctly installed and configured.

5.5 Run/Debug Configurations

A particular project can be configured such that a specific device or emulator is used automatically each time it is run from within Android Studio. This avoids the necessity to make a selection from the device chooser each time the application is executed. To review and modify the Run/Debug configuration, click on the button to the left of the run button in the Android Studio toolbar and select the *Edit Configurations…* option from the resulting menu:

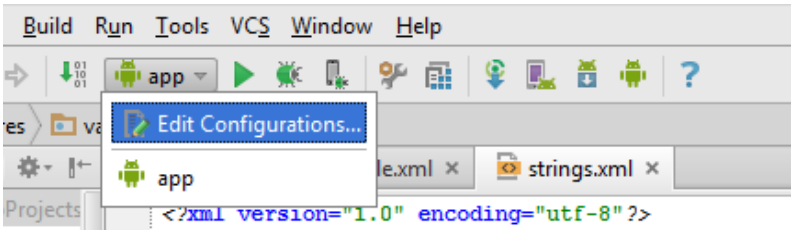

Figure 5-9

In the *Run/Debug Configurations* dialog, the application may be configured to always use a preferred emulator by enabling the *Emulator* option listed in the *Target Device* section and selecting the emulator from the drop down menu. Figure 5-10, for example, shows the AndroidSample application configured to run by default on the previously created Nexus 7 emulator:

http://freepdf-books.com

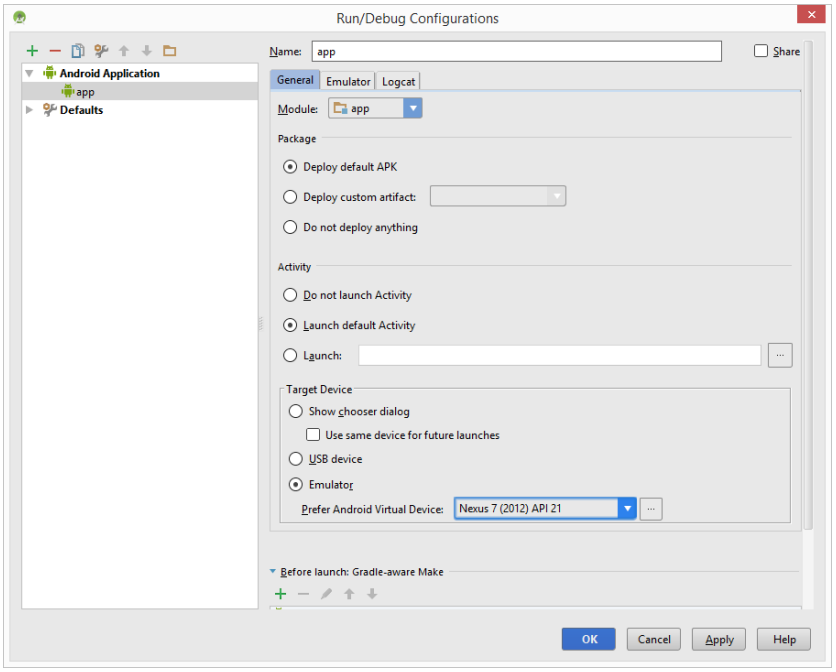

Figure 5-10

5.6 Stopping a Running Application

When building and running an application for testing purposes, each time a new revision of the application is compiled and run, the previous instance of the application running on the device or emulator will be terminated automatically and replaced with the new version. It is also possible, however, to manually stop a running application from within Android Studio.

To stop a running application, begin by displaying the *Android* tool window either using the window bar button, or via the quick access menu (invoked by moving the mouse pointer over the button in the left hand corner of the status bar as shown in Figure 5-11).

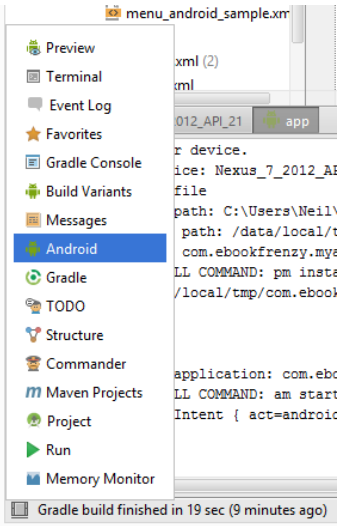

Figure 5-11

Once the Android tool window appears, make sure that the *Devices | ADB Logs* tab is selected, and that the Nexus 7 emulator entry is selected in the Devices panel. From the list of processes located beneath the device name, find and select the *androidsample* process as outlined in Figure 5-12:

http://freepdf-books.com

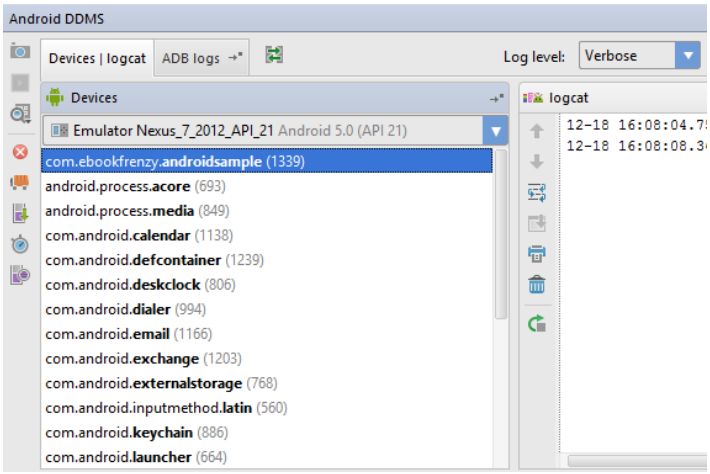

Figure 5-12

With the process selected, stop it by clicking on the red *Terminate Application* button in the vertical toolbar to the left of the process list:

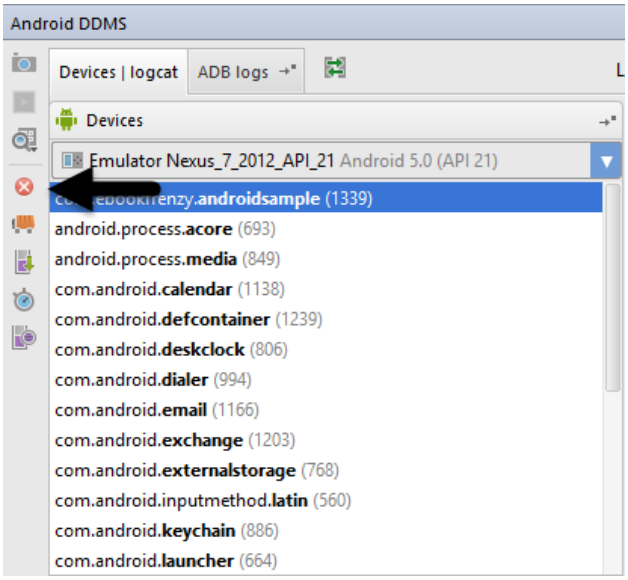

Figure 5-13

An alternative to using the Android tool window is to open the Android Debug Monitor. This can be launched via the *Tools -> Android -> Android Device Monitor* menu option. Once launched, the process may be selected from the list (Figure 5-14) and terminated by clicking on the red *Stop* button located in the toolbar above the list.

http://freepdf-books.com

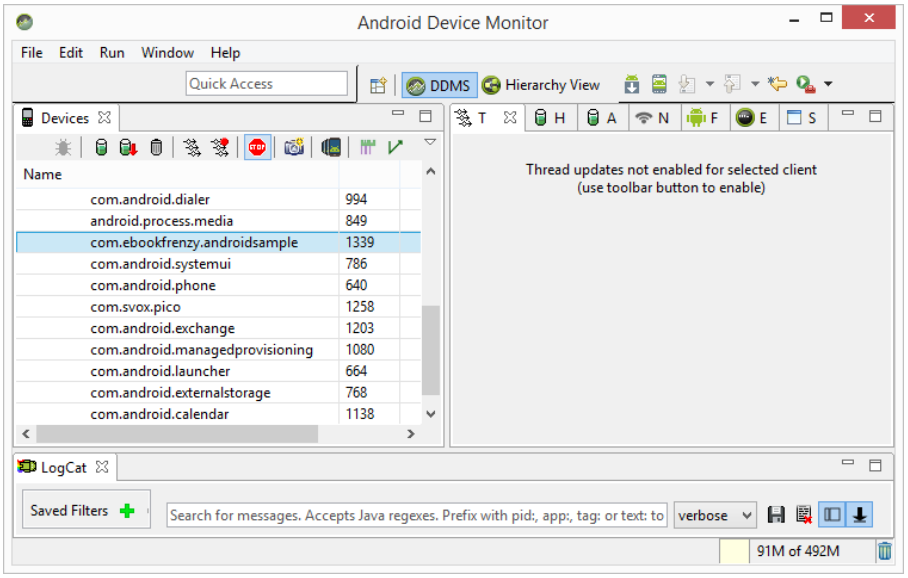

Figure 5-14

5.7 AVD Command-line Creation

As previously discussed, in addition to the graphical user interface it is also possible to create a new AVD directly from the command-line. This is achieved using the *android* tool in conjunction with some command-line options. Once initiated, the tool will prompt for additional information before creating the new AVD.

Assuming that the system has been configured such that the Android SDK *tools* directory is included in the PATH environment variable, a list of available targets for the new AVD may be obtained by issuing the following command in a terminal or command window:

```
android list targets
```

The resulting output from the above command will contain a list of Android SDK versions that are available on the system. For example:

```
Available Android targets:
----------
id: 1 or "android-21"
     Name: Android 5.0.1
     Type: Platform
     API level: 21
     Revision: 2
     Skins: HVGA, QVGA, WQVGA400, WQVGA432, WSVGA, WVGA800 (default), WVGA854, WXGA720,
WXGA800, WXGA800-7in
 Tag/ABIs : default/armeabi-v7a
```

The syntax for AVD creation is as follows:

```
android create avd -n <name> -t <targetID> [-<option> <value>]
```

For example, to create a new AVD named *Nexus7* using the target id for the Android 4.4 API level 19 device (in this case id 1), the following command may be used:

```
android create avd -n Nexus7 -t 1
```

http://freepdf-books.com

The android tool will create the new AVD to the specifications required for a basic Android 5.0.1 device, also providing the option to create a custom configuration to match the specification of a specific device if required. Once a new AVD has been created from the command line, it may not show up in the Android Device Manager tool until the *Refresh* button is clicked.

In addition to the creation of new AVDs, a number of other tasks may be performed from the command line. For example, a list of currently available AVDs may be obtained using the *list avd* command line arguments:

```
android list avd

Available Android Virtual Devices:
    Name: GenericAVD
    Path: C:\Users\Neil\.android\avd\GenericAVD.avd
  Target: Android 5.0.1 (API level 21)
 Tag/ABI: default/armeabi-v7a
    Skin: WVGA800
---------
    Name: Nexus_7_2012_API_21
  Device: Nexus 7 (Google)
    Path: C:\Users\Neil\.android\avd\Nexus_7_2012_API_21.avd
  Target: Android 5.0.1 (API level 21)
 Tag/ABI: default/armeabi-v7a
    Skin: nexus_7
  Sdcard: C:\Users\Neil\.android\avd\Nexus_7_2012_API_21.avd\sdcard.img
Snapshot: yes
```

Similarly, to delete an existing AVD, simply use the *delete* option as follows:

```
android delete avd –n <avd name>
```

5.8 Android Virtual Device Configuration Files

By default, the files associated with an AVD are stored in the *.android/avd* sub-directory of the user's home directory, the structure of which is as follows (where *<avd name>* is replaced by the name assigned to the AVD):

```
<avd name>.avd/config.ini
<avd name>.avd/userdata.img
<avd name>.ini
```

The *config.ini* file contains the device configuration settings such as display dimensions and memory specified during the AVD creation process. These settings may be changed directly within the configuration file and will be adopted by the AVD when it is next invoked.

The *<avd name>.ini* file contains a reference to the target Android SDK and the path to the AVD files. Note that a change to the *image.sysdir* value in the *config.ini* file will also need to be reflected in the *target* value of this file.

5.9 Moving and Renaming an Android Virtual Device

The current name or the location of the AVD files may be altered from the command line using the *android* tool's *move avd* argument. For example, to rename an AVD named Nexus7 to Nexus7B, the following command may be executed:

```
android move avd -n Nexus7 -r Nexus7B
```

To physically relocate the files associated with the AVD, the following command syntax should be used:

http://freepdf-books.com

```
android move avd -n <avd name> -p <path to new location>
```

For example, to move an AVD from its current file system location to /tmp/Nexus7Test:

```
android move avd -n Nexus7 -p /tmp/Nexus7Test
```

Note that the destination directory must not already exist prior to executing the command to move an AVD.

5.10 Summary

A typical application development process follows a cycle of coding, compiling and running in a test environment. Android applications may be tested on either a physical Android device or using an Android Virtual Device (AVD) emulator. AVDs are created and managed using the Android AVD Manager tool which may be used either as a command line tool or using a graphical user interface. When creating an AVD to simulate a specific Android device model it is important that the virtual device be configured with a hardware specification that matches that of the physical device.

Chapter 6

6. Testing Android Studio Apps on a Physical Android Device

Whilst much can be achieved by testing applications using an Android Virtual Device (AVD), there is no substitute for performing real world application testing on a physical Android device and there are a number of Android features that are only available on physical Android devices.

Communication with both AVD instances and connected Android devices is handled by the *Android Debug Bridge (ADB).* In this chapter we will work through the steps to configure the adb environment to enable application testing on a physical Android device with Mac OS X, Windows and Linux based systems.

6.1 An Overview of the Android Debug Bridge (ADB)

The primary purpose of the ADB is to facilitate interaction between a development system, in this case Android Studio, and both AVD emulators and physical Android devices for the purposes of running and debugging applications.

The ADB consists of a client, a server process running in the background on the development system and a daemon background process running in either AVDs or real Android devices such as phones and tablets.

The ADB client can take a variety of forms. For example, a client is provided in the form of a command-line tool named *adb* located in the Android SDK *platform-tools* sub-directory. Similarly, Android Studio also has a built-in client.

A variety of tasks may be performed using the *adb* command-line tool. For example, a listing of currently active virtual or physical devices may be obtained using the *devices* command-line argument. The following command output indicates the presence of an AVD on the system but no physical devices:

```
$ adb devices
List of devices attached
emulator-5554   device
```

6.2 Enabling ADB on Android 5.0 based Devices

Before ADB can connect to an Android device, that device must first be configured to allow the connection. On phone and tablet devices running Android 5.0 or later, the steps to achieve this are as follows:

1. Open the Settings app on the device and select the *About tablet* or *About phone* option.
2. On the *About* screen, scroll down to the *Build number* field (Figure 6-1) and tap on it seven times until a message appears indicating that developer mode has been enabled.

http://freepdf-books.com

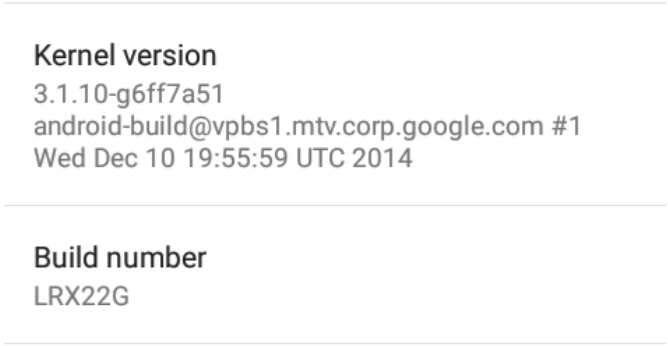

Figure 6-1

3. Return to the main Settings screen and note the appearance of a new option titled *Developer options*. Select this option and locate the setting on the developer screen entitled *USB debugging*. Enable the checkbox next to this item as illustrated in Figure 6-2 to enable the adb debugging connection.

Figure 6-2

4. Swipe downward from the top of the screen to display the notifications panel (Figure 6-3) and note that the device is currently connected as a *media device*.

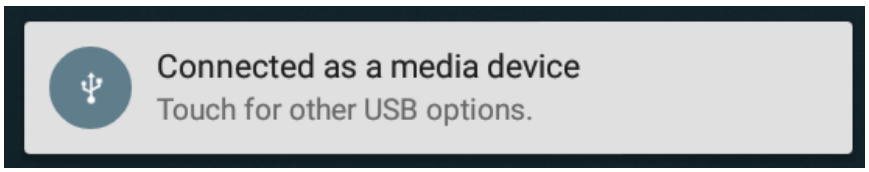

Figure 6-3

At this point, the device is now configured to accept debugging connections from adb on the development system. All that remains is to configure the development system to detect the device when it is attached. Whilst this is a relatively straightforward process, the steps involved differ depending on whether the development system is running Windows, Mac OS X or Linux. Note that the following steps assume that the Android SDK *platform-tools* directory is included in the operating system PATH environment variable as described in the chapter entitled *Setting up an Android Studio Development Environment*.

6.2.1 Mac OS X ADB Configuration

In order to configure the ADB environment on a Mac OS X system, connect the device to the computer system using a USB cable, open a terminal window and execute the following command:

```
android update adb
```

Next, restart the adb server by issuing the following commands in the terminal window:

```
$ adb kill-server
$ adb start-server
* daemon not running. starting it now on port 5037 *
* daemon started successfully *
```

http://freepdf-books.com

Once the server is successfully running, execute the following command to verify that the device has been detected:

```
$ adb devices
List of devices attached
74CE000600000001        offline
```

If the device is listed as *offline*, go to the Android device and check for the presence of the dialog shown in Figure 6-8 seeking permission to *Allow USB debugging.* Enable the checkbox next to the option that reads *Always allow from this computer*, before clicking on *OK*. Repeating the *adb devices* command should now list the device as being available:

```
List of devices attached
015d41d4454bf80c        device
```

In the event that the device is not listed, try logging out and then back in to the Mac OS X desktop and, if the problem persists, rebooting the system.

6.2.2 Windows ADB Configuration

The first step in configuring a Windows based development system to connect to an Android device using ADB is to install the appropriate USB drivers on the system. In the case of some devices, the *Google USB Driver* must be installed (a full listing of devices supported by the Google USB driver can be found online at http://developer.android.com/sdk/win-usb.html).

To install this driver, perform the following steps:

1. Launch Android Studio and open the Android SDK Manager, either by selecting *Configure -> SDK Manager* from the Welcome screen, or using the *Tools -> Android -> SDK Manager* menu option when working on an existing project.
2. Scroll down to the *Extras* section and check the status of the *Google USB Driver* package to make sure that it is listed as *Installed.*
3. If the driver is not installed, select it and click on the *Install packages* button to initiate the installation.
4. Once installation is complete, close the Android SDK Manager.

For Android devices not supported by the Google USB driver, it will be necessary to download the drivers provided by the device manufacturer. A listing of drivers and download information can be obtained online at http://developer.android.com/tools/extras/oem-usb.html.

When an Android device is attached to a Windows system it is configured as a *Portable Device*. In order for the device to connect to ADB it must be configured as an *Android ADB Composite Device*.

First, connect the Android device to the computer system if it is not currently connected. Next, display the Control Panel and select Device Manager. In the resulting dialog, check for a category entitled *Other Devices*. Unfold this category and check to see if the Android device is listed (in the case of Figure 6-4, a Nexus 7 has been detected):

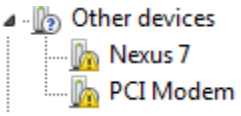

Figure 6-4

Right-click on the device name and select *Update Driver Software* from the menu. Select the option to *Browse my computer for driver software* and in the next dialog, keep the *Include subfolder* option selected and click on the *Browse…* button. Navigate to the location into which the USB drivers were installed. In the case of the Google USB driver, this will be in the *sdk\extras\google\usb_driver* subfolder of the Android Studio installation directory (the location of which can be found in the SDK Manager). Once located, click on *OK* to select the driver folder followed by *Next* to initiate the installation.
